| | Index | 559 |

Library for retrieving and working with SKA Telescope Model information. What we are concerned with is enabling different SKA sub-systems to agree about information - such as shared assumptions about:

- the physical location of telescope receptors (i.e. dishes or stations), or
- configuration of the correlator and its connections to links, or
- internal configuration templates for sub-systems

This sort of information evolves relatively slowly and is in many cases too voluminous to be exchanged between systems in real time. On the other hand, especially for information characterising knowledge about the telescope, we will need to evolve it independently of the software development lifecycle.

For this purpose, this library provides:

- Means to access versioned telescope model data
- Schemas to check whether telescope model data is valid
- Ways for interpret and transform telescope model information

INSTALLATION

Install using pip from the SKAO central artefact repository:

```
pip install --extra-index-url https://artefact.skao.int/repository/pypi-internal/simple_
↳ska-telmodel
```

1.1 SKA Telescope Model

Library for retrieving and working with SKA Telescope Model information. What we are concerned with is enabling different SKA sub-systems to agree about information - such as shared assumptions about:

- the physical location of telescope receptors (i.e. dishes or stations), or
- configuration of the correlator and its connections to links, or
- internal configuration templates for sub-systems

This sort of information evolves relatively slowly and is in many cases too voluminous to be exchanged between systems in real time. On the other hand, especially for information characterising knowledge about the telescope, we will need to evolve it independently of the software development lifecycle.

For this purpose, this library provides:

- Means to access versioned telescope model data
- Schemas to check whether telescope model data is valid
- Ways for interpret and transform telescope model information

1.1.1 Installation

Install using pip from the SKAO central artefact repository:

```
pip install --extra-index-url https://artefact.skao.int/repository/pypi-internal/simple_
↳ska-telmodel
```

1.2 Change Log

All notable changes to this project will be documented in this file. This project adheres to [Semantic Versioning](#).

1.2.1 1.14.1

- Allow the same k value be used by multiple receptors in Mid CBF InitSysParams.

1.2.2 1.14.0

- Created schema for Low CSP.
- Moved PST schema in a separate folder and created its own URI.
- Nakshatra changes implemented in Low CSP/CBF.
- Reorganization of the documentation structure.
- Added CSP LOW delaymodel json schema as per ADR-88.
- Unit test cases to verify the validations for added CSP LOW delay model schema.
- Updated documentation for CSP LOW delaymodel.

1.2.3 1.13.0

- Added initial version of Observatory Static Data.
- Integrated Observatory Static Data (OSD) with existing semantic validation framework.

1.2.4 1.12.0

- Extended support of semantic validation for Scheduling Block Definition.
- Updated existing semantic validation test-cases.
- Updated documentation for CSP LOW assignresources command.

1.2.5 1.11.2

- Updated datatype of epoch in delayModel to float

1.2.6 1.11.1

- Updated PST Flow Through configuration

1.2.7 1.11.0

- Added new schema section for TMC LOW commands
- Added initial Semantic Validation for LOW observing setup

1.2.8 1.10.0

- Added new schema section for midcbf InitSysParams command
- Added schema and test cases for midcbf InitSysParams command

1.2.9 1.9.2

- Added new field z_pos to antenna_geojson structure
- Added documentation for station and antenna geojson

1.2.10 1.9.1

- Mid cbf scan_id changed from string to integer (SKB-254)
- Added tutorials to restructured documentation
- Support shortened “car:” URI scheme (defaults to “gitlab.com/ska-telescope/” prefix and “#tmdata” segment)

1.2.11 1.9.0

- Adds support for partial configuration with Target-offset parameters to enable 5-point calibration scans. (BTN-2052)
- Adds a new module for semantic validation of Low telescope configuration. (NAK-673)

1.2.12 1.8.2

- Bugfix: ‘simpleeval’ and ‘astropy’ are required in production, not only as development dependencies.

1.2.13 1.8.1

- Update receptor validation and example values to match ADR-32
- Added optional eb_id to CSP common schema

1.2.14 1.8.0

- Fixed semantic validation issue on receptor_id and fsp_id for AA0.5 schema.
- Add new “car://” backend type that behaves like “nexus://”, but enforces that data comes from artefact repository
- Fix handling of the CAR_RAW_REPOSITORY_URL to fix behaviour in CI pipelines
- Added station_id to version 1.1 of the receptor schema
- Renamed station_name to station_label in version 1.1 of the receptor schema
- Added the various changes required to the update scripts
- Add documentation for Mid.CBF command schema

1.2.15 1.7.0

- Added new semantic validation support for AA0.5 schema

1.2.16 1.6.0

- Add schemas for Low CBF configuration commands
- Add receptor_id to version 2.1 of TMC release resource schema

1.2.17 1.5.0

- Add version 2.1 of SKA-MID assign,configure,release,scan schema to support standardised keys.

1.2.18 1.4.1

- PST schema updates following review

1.2.19 1.4.0

- Added telescope model data interface to query sources of truth on matters of static telescope information
- Added layout schemas in support to provide data for delay modelling. Including schemas for geocentric, geodec-tic and local positions, and fixed delays.
- Added delay model schema to CSP
- Refactored CSP version code for config to use common version check function

1.2.20 1.3.3

- SDP schema refactoring
- Implement SDP scan metadata required for multi-scan support (version 0.4, including new ReleaseResources schema)
- Add receive address propagation support for PSS & PST
- Introduced CSP schemas and examples: assignresources, scan, endscan, and releaseresources

1.2.21 1.3.2

- Using standard SKAO CI stages now
- Substantial internal code refactoring - build schemas incrementally
- Add PST (Pulsar Timing) configuration schemas to CSP
- Add PSS (Pulsar Search) configuration schemas to CSP

1.2.22 1.3.1

- Update values in example file for CSP Configure schema
- Enhance CSP Schema version check logic

1.2.23 1.3.0

- Add version 2.0 of CSP Configure schema to support standardised keys (ADR-35)
- Add version 2.0 of TMC schemas for SKA-Low to support standardised keys (ADR-35)

1.2.24 1.2.0

- Add version 0.3 of SDP schemas to support standardised keys (ADR-35)

1.2.25 1.1.0

- Introduce TMC configuration to the TMC SubArrayNode.Configure schema

1.2.26 1.0.0

- Introduced schema for TMC CentralNode and TMC SubArrayNode, currently just for SKA LOW.
- Introduced schema for MCCSController and MCCSSubarray

1.2.27 0.3.0

- Generate schema description into Sphinx documentation instead of using footprint
- Replaces specialised validation routines by a general one that selects the schema by the URI.

1.2.28 0.2.0

- Implementation of changes in CSP configuration string according ADR-18
- Especially add stubs for PSS and PST configuration
- Rework version handling to use URIs as suggested by ADR-22

1.2.29 0.1.4

- Accept raw dictionaries instead of strings

1.2.30 0.1.3

- Added SDP schema verifications

1.2.31 0.1.2

- Added CSP schema verification

1.2.32 0.1.1

- Renamed *outputChannelOffset* to *fspChannelOffset*

1.2.33 0.1.0

- Initial release
- Added CSP interface generation

1.3 Getting Started

1.3.1 Installation

Install using pip from the SKAO central artefact repository:

```
$ pip install --extra-index-url https://artefact.skao.int/repository/pypi-internal/  
↪simple ska-telmodel
```

1.3.2 Simple usage

List data

You can now use the command line utility to list default telescope model data:

```
$ ska-telmodel ls
instrument/mccs-configuration/station_export_w2.json
instrument/mccs-configuration/antenna_export_w2.json
instrument/ska1_low/layout/low-layout.json
instrument/ska1_low/layout/data.json
instrument/ska1_low/layout/README.md
[...]
```

You can achieve the same thing from Python as follows:

```
from ska_telmodel.data import TMDData
for key in TMDData(): print(key)
```

Retrieve data

You can easily retrieve data from the command line as well:

```
$ ska-telmodel cat instrument/ska1_low/layout/README.md

SKA Low layout
-----
[...]
```

Again, the same can be achieved from Python:

```
from ska_telmodel.data import TMDData
print(TMDData()['instrument/ska1_low/layout/README.md'].get().decode())
```

For JSON or YAML data, you can especially retrieve it parsed:

```
print(TMDData()['software/tango/ska_wide/Guidelines.yaml'].get_dict())
# -> [{'class': None, [...]}]
```

1.3.3 Data sources

Local directory

`ska-telmodel` has a number of default data sources built-in, which we have been querying above. However, you can override this. For instance, you can use a local directory as a source:

```
$ mkdir tmdemo
$ echo Test! > tmdemo/test.txt
$ ska-telmodel ls --sources=file://tmdemo
test.txt
$ ska-telmodel cat --sources=file://tmdemo test.txt
Test!
```

This works similarly from Python:

```
from ska_telmodel.data import TMDData
tmdata = TMDData(['file://tmdata_demo'])
print(tmdata['test.txt'].get().decode())
# -> Test!
```

A useful pattern is to use this to create a local copy of telescope model data (see `ska_telmodel.cli.cmd_cp()`).

Gitlab & CAR sources

You can also use any Gitlab directory as a source:

```
$ ska-telmodel ls --sources=gitlab://gitlab.com/ska-telescope/ska-telmodel?master#tmdata/
↳ software
UserWarning: gitlab://gitlab.com/ska-telescope/ska-telmodel?master#tmdata/software not
↳ cached in SKA CAR - make sure to add tmdata CI!
warnings.warn(warning)

tango/dsh/DishManager.yaml
tango/ska_wide/Guidelines.yaml
tango/ska_wide/SKABaseDevice.yaml
tango/ska_wide/SKAMaster.yaml
```

This is useful for development, but as the warning indicates should **not** be used seriously, as Gitlab will eventually start blocking these kinds of requests. A better approach is to use the SKAO central artefact repository (CAR) as the source:

```
$ ska-telmodel ls --sources=car:ska-telmodel?master
instrument/ska1_mid/validation/mid-validation-constants.json
software/tango/ska_wide/Guidelines.yaml
software/tango/ska_wide/SKAMaster.yaml
software/tango/ska_wide/SKABaseDevice.yaml
software/tango/dsh/DishManager.yaml
```

Using the `car:` URI we are now referring to an archive artefact, typically mirroring the contents of a repository (see [Adding a New Gitlab Data Source](#)).

Dynamic sources

The source URIs given above point to dynamic branches (`master`), which means that the results of queries against telescope model data might change. For instance we can go:

```
$ echo Test! > tmdata_demo/test.txt
$ git switch -c my_test_branch
$ git add tmdata_demo/test.txt; git commit -m "Telescope model data test"; git push my_
↳ test_branch origin
$ export SKA_TELMODEL_SOURCES=gitlab://gitlab.com/ska-telescope/ska-telmodel?my_test_
↳ branch#tmdata_demo
$ ska-telmodel ls
test.txt
$ ska-telmodel cat test.txt
Test!
$ echo Test2! > tmdata_demo/test.txt
```

(continues on next page)

(continued from previous page)

```
$ git add tmdata_demo/test.txt; git commit -m "Telescope model data test 2"; git push my_
↪ test_branch origin
$ ska-telmodel cat test.txt
Test!
$ ska-telmodel cat --update test.txt
Test2!
```

Note that the result of our query changed - albeit only after we passed `--update`, which forced a refresh of the cache. A CAR data source would have the same behaviour if a new package was uploaded by a CI pipeline.

In Python we would achieve the equivalent as follows:

```
from ska_telmodel.data import TMDData
sources = ['gitlab://gitlab.com/ska-telescope/ska-telmodel?my_test_branch#tmdata_demo']
tmdata = TMDData(sources, update=True)
print(['test.txt'].get().decode())
```

Pinning dynamic sources

This dynamic behaviour might be useful in development, but when running code in testing or production, we would like more reproducibility. This is why it is a good idea to “pin” dynamic sources to a specific version. One approach is to refer to a fixed “tag”:

```
$ ska-telmodel --sources=car:ska-telmodel?1.5.0 ls
software/tango/ska_wide/Guidelines.yaml
software/tango/ska_wide/SKAMaster.yaml
software/tango/ska_wide/SKABaseDevice.yaml
software/tango/dsh/DishManager.yaml
```

Now we are effectively referring to a “telescope model data release”, which is permanently stored in the CAR and will always give the same result. Note that every repository publishing telescope model data might have its own independent version history, and there’s especially no connection to the version of the telescope model data library.

Another approach is to “pin” sources, which resolves them to hashes:

```
$ export `ska-telmodel -U pin`
Using car:ska-telmodel-data?~9d576afb2f8980bab1fea5d82fa80ddfa91fba21
Using car:ska-telmodel?~719f0146df1de15dfaaa1780847de656ce35c29a
Using car:mccs/ska-low-mccs?~6d98ac66b188d9943b2af19e3e5f2f317da384e8
$ echo $SKA_TELMODEL_SOURCES
car:ska-telmodel-data?~9d576afb2f8980bab1fea5d82fa80ddfa91fba21,car:ska-telmodel?~
↪ 719f0146df1de15dfaaa1780847de656ce35c29a,car:mccs/ska-low-mccs?~
↪ 6d98ac66b188d9943b2af19e3e5f2f317da384e8
```

In Python we would achieve the same as follows:

```
from ska_telmodel.data import TMDData
sources = TMDData(update=True).get_sources(pinned=True)
print(sources)
# -> ['car:ska-telmodel-data?~9d576afb2f8980bab1fea5d82fa80ddfa91fba21', 'car:ska-telmodel?
↪ ~719f0146df1de15dfaaa1780847de656ce35c29a', 'car:mccs/ska-low-mccs?~
↪ 6d98ac66b188d9943b2af19e3e5f2f317da384e8']
```

At this point we would be able to pass sources to a different component (e.g. a configured sub-system):

```
# Set telescope model data to use, issue call to other component
config['sources'] = tmdata.get_sources(pinned=True)
config['layout_key'] = 'instrument/ska1_low/layout/data.json'
otherComponent.Command(json.dumps(config))
```

Now another component (e.g. Tango device) could get the data pointed at as follows:

```
def Command(self, config_str):
    config = json.loads(config_str)
    tmdata = TMDData(config['sources'])
    layout = tmdata[config['layout_key']]
```

At this point we could be sure that the second piece of code has exactly the same view of telescope model data - regardless of any updates to telescope model data that might have happened in the meantime.

Permanently adding or changing files

In *Dynamic sources* we used a Gitlab source to quickly add a file, but this is not how you would add files to telescope model data permanently. As explained in the last section, to add data long-term we want to make them part of telescope model data “releases” persisted in the central artefact repository (such as `car:ska-telmodel?1.5.0`).

The idea is that **any** SKAO repository can release such telescope model data packages, similar to how any repository can publish (say) Python packages. For instance, the following repositories currently publish telescope model data:

- <https://gitlab.com/ska-telescope/ska-telmodel> - telescope model data directly associated with the telescope model library (data for semantic validation)
- <https://gitlab.com/ska-telescope/ska-telmodel-data> - shared information about the telescope, such as receptor positions
- <https://gitlab.com/ska-telescope/mccs/ska-low-mccs> - MCCS configuration information

You can view the information coming from these repositories as usual:

```
$ ska-telmodel --sources=car:mccs/ska-low-mccs?master ls
instrument/mccs-configuration/station_export_w2.json
instrument/mccs-configuration/antenna_export_w2.json
```

To add your own information, you need to:

1. Identify the repository to add the information to. If your telescope model data does not fit into an existing repository that publishes telescope model data, check [Adding a New Gitlab Data Source](#) for how to set up a new repository to publish telescope model data.
2. Add the data to the `tmdata` folder in the repository, e.g. using a merge request. Make sure you choose a good path within it, because it will be global, see [Data](#). Once merged, you should be able to see your file using `ska-telmodel --sources=car:ska-your-repo?main` (assuming your main branch is called `main`, otherwise `master`)
3. Optional: Release your repository (i.e. create a tag) to create a versioned telescope model data package, which can then be accessed using `ska-telmodel --sources=car:ska-your-repo?a.b.c` where `a.b.c` is the release version.

Further information

For more in-depth guides, check *Usage Guide*. There is also an SKAO Slack channel for helping users and developers of the SKA telescope model - `#help-telmodel`.

1.4 Usage Guide

1.4.1 Data

Telescope model data is stored as *objects* identified as *keys*. Each key takes the following form:

```
[domain]/([sub-domain]/)*[name].[type]
```

Where

- `[domain]/` specifies the coarse top-level telescope model data domain.
- `[sub-domain]/` provides further hierarchical data sub-categories
- `[name]` associates a name with the telescope model data.
- `[type]` identifies the file type, which is used to identify the kind of file contents. The library currently supports `json` and `yaml`.

Names should be chosen for being self-describing and stable long-term. Top-level domains:

```
environment/...  # Environment telescopes are deployed in
instrument/...   # Telescopes and their equipment
software/...     # Software deployed to the telescopes
```

To retrieve a particular piece of data from the telescope model, simply construct an `ska_telmodel.data.TMData` object and use the `[]` operator to access:

```
from ska_telmodel.data import TMData
tmdata = TMData()
print(tmdata['instrument/ska1_low/layout/low-layout.json'].get_dict())
```

This works because the telescope model comes with a number of default sources that will be checked for matching telescope model data. `ska_telmodel.data.TMObject.get_dict()` automatically parses and converts JSON and YAML documents, but you can also get the raw data using `ska_telmodel.data.TMObject.get()`, or open or copy the contents as a file using `ska_telmodel.data.TMObject.open()` or `ska_telmodel.data.TMObject.copy()` respectively.

To get an idea what is contained in a particular part of the telescope model data tree, simply iterate over it (equivalent to `ska_telmodel.cli.cmd_ls()`):

```
from ska_telmodel.data import TMData
tmdata = TMData()
for key in tmdata['instrument']:
    print(key)
```

Logically, the `[]` operator constructs a sub-set of all telescope model data. If the key is a valid object name (i.e. has an extension, so contains a `.`) this subset is assumed to contain only a single object, and the `[]` operator will return a `ska_telmodel.data.TMObject` instance.

1.4.2 Data Sources

Telescope model data can be retrieved from a list of sources, which can be specified to the `ska_telmodel.data.TMData` constructor, using the `SKA_TELMODEL_SOURCES` environment variable or left to in-built `ska_telmodel.data.sources.DEFAULT_SOURCES`. Each source is represented as an URI that specifies the source of truth for some portion of telescope model data.

The following telescope model data backends are currently supported:

- `mem://?[key1]=[value1]&[key2]=[value2]` (see `ska_telmodel.data.backend.MemoryBackend`)
- `file://[absolute path]` (see `ska_telmodel.data.backend.FilesystemBackend`)
- `gitlab://[gitlab server]/[project name]?[branch]#[directory]` (see `ska_telmodel.data.backend.GitlabBackend`)
- `car://[gitlab server]/[project name]?[branch]#[directory]` (see `ska_telmodel.data.backend.CARBackend`)

The simplest example would be to utilise `ska_telmodel.data.backend.MemoryBackend` to set a key directly:

```
from ska_telmodel.data import TMData
tmdata = TMData(['mem://?test.txt=test_data'])
print(tmdata['test.txt']) # -> b"test_data\n"
```

This can also be configured using environment variables:

```
import os
from ska_telmodel.data import TMData
os.environ['SKA_TELMODEL_SOURCES'] = 'mem://?test.txt=test_data'
tmdata = TMData()
print(tmdata['test.txt']) # -> b"test_data\n"
```

You would typically do this from outside your program, see the documentation for `ska_telmodel.cli.cmd_pin()` and `ska_telmodel.cli.cmd_cp()` for examples.

A more complex example would be to retrieve data from Gitlab using `ska_telmodel.data.backend.GitlabBackend`:

```
from ska_telmodel.data import TMData
gl_uri = 'car://gitlab.com/ska-telescope/ska-telmodel?master#tmdata'
tmdata = TMData([gl_uri])
print(tmdata['software/tango/dsh/DishManager.yaml'])
```

This will retrieve data directly from the telescope model library repository.

Note that external telescope model data sources using `ska_telmodel.data.backend.GitlabBackend` or `ska_telmodel.data.backend.CARBackend` will cache data locally in order to prevent repeated requests to servers. This means that if we reference a Gitlab branch (like `master` in the example), the telescope model data in the cache might go out of sync with the server.

This is intentional, as it means that we provide a consistent view of telescope model data as long as possible. It is generally best to use “pinned” sources (see `ska_telmodel.cli.cmd_pin()`), but in day-to-day usage, you can simply use the `-U` flag as documented in *Command Line Usage* or (less preferably) the `update` option to `ska_telmodel.data.TMData` to occasionally refresh the cache as needed. The library will occasionally check for and warn about stale caches.

1.4.3 Adding a New Gitlab Data Source

If you want others to be able to view data in your GitLab repository using `ska_telmodel.data.backend.GitlabBackend` or `ska_telmodel.data.backend.CARBackend`, first you will need to place the data you wish to export in a top level dictionary in your repo named `tmdata`. For example:

```
/tmdata/instrument/mccs_configuration/config_file_low.json
/tmdata/instrument/mccs_configuration/config_file_mid.json
```

Important to note:

- Try to use a directory structure that is compatible with domains (see above) and is reasonably likely to remain stable.
- Currently only `.json` and `.yaml` files are accepted, and you should have schemas associated with them.

Next add telescope model data support to your top-level Makefile as documented in <https://developer.skao.int/projects/ska-cicd-makefile/en/latest/README.html> :

```
include .make/tmdata.mk
```

At this point you should be able to verify that `make tmdata-package` will result in both a `tmtree.json` and a `tmdata.tar.gz` file getting created in `build/tmdata`. Next add the packaging and publishing stage to your Gitlab pipeline by adding the following lines to the `.gitlab-ci.yml` file as documented in <https://developer.skao.int/projects/templates-repository/en/latest/README.html> :

```
- project: 'ska-telescope/templates-repository'
  file: 'gitlab-ci/includes/tmdata.gitlab-ci.yml'
```

Now once you merge these changes into the `main` branch, others will be able to access this data by specifying your repository as the source:

```
$ ska_telmodel --sources=car:mccs/ska-low-mccs?main ls
instrument/mccs_configuration/config_file_low.json
instrument/mccs_configuration/config_file_mid.json
```

Branches other than `main` will also work, just adjust the URL accordingly. However by default the GitLab pipeline will only upload the TMDData package to the artefact repository on the `main` branch as well as tags.

If you want the data to be accessible without passing command line parameters, make a merge request to the `ska_telmodel` repository (https://gitlab.com/ska-telescope/ska_telmodel) that adds your repository address the `src/ska_telmodel/data/source.py` file. This makes your telescope model data available “globally”:

```
$ ska_telmodel ls
[...]
instrument/mccs_configuration/config_file_low.json
instrument/mccs_configuration/config_file_mid.json
```

1.4.4 Schemas

Schemas check JSON-like objects for conformance, e.g. nested dictionaries containing primitives and lists. They especially have a JSON schema representation - though `ska_telmodel.schema.validate()` will generally implement more thorough checks.

All schemas are identified by an URI of the form:

```
https://schema.skao.int/ska-[subsystem]-[interface]/[major].[minor]
```

The entire URI should be lower-case alphanumerical. The `[subsystem]` identifies the leading party for maintaining the schema, and `[interface]` the concrete interface implemented. Depending on context, this might either be data produced or consumed by the sub-system in question.

Versioning should follow semantic versions: Changes in minor version indicate backwards-compatible changes such as adding new fields or otherwise introducing additional accepted schemas. Changes that break backwards compatibility should change the major version.

You can use the URIs with `ska_telmodel.schema.validate()` to validate data:

```
from ska_telmodel.data import TMDData
from ska_telmodel.schema import validate

uri = "https://schema.skao.int/ska-telmodel-layout-location/0.0"
layout_dict = TMDData()['instrument/ska1_low/layout/low-layout.json'].get_dict()
validate(uri, layout_dict)
```

Furthermore you can use `ska_telmodel.schema.example_by_uri()` to retrieve examples of certain schemas (which are replicated in the schema section of this documentation).

1.5 Command Line Usage

The library provides the `ska-telmodel` command line utility that can be used to perform basic data retrieval and validation tasks. Usage examples:

```
ska-telmodel [-vULS<uris>] cat [<key>]
ska-telmodel [-vULS<uris>] cp [-R] <key> [<path>]
ska-telmodel [-vULS<uris>] ls [<prefix>]
ska-telmodel [-vULS<uris>] pin
ska-telmodel [-vULS<uris>] validate [-tR] <key/path>
ska-telmodel help [<command>]
```

Options:

| | |
|--|--|
| <code>-L, --local</code> | Equivalent to " <code>--sources=file://.</code> " |
| <code>-R, --recursive</code> | Copy / validate keys or files recursively |
| <code>-S <uris>, --sources <uris></code> | Set telescope model data sources of truth (<code>'</code> , <code>'</code> -separated list of URIs) |
| <code>-t, --strict</code> | Strict validation mode |
| <code>-U, --update</code> | Update source list |
| <code>-v, --verbose</code> | Verbose mode |

See [Data Sources](#) for explanations about telescope model data sources.

`ska_telmodel.cli.cmd_cat(args, data)`

Retrieves and prints the telescope model data identified by the given key to stdout.

Usage:

```
ska-telmodel [-vUs<uris>] cat [<key>]
```

Use `ska-telmodel ls` to obtain a list of valid keys.

How exactly the object is retrieved depends on the backend and the state of the cache. For a GitLab backend, the typical behaviour is to download a tarball either from the SKAO central artefact repository, or from GitLab directly. The latter should be avoided and will generate a warning.

`ska_telmodel.cli.cmd_cp(args, srcs)`

Retrieves specified telescope model data, and copies it to the given path.

Usage:

```
ska-telmodel [-vUs<uris>] cp [-R] <key> [<path>]
```

If `-R` is given, the key can be a key directory, in which all keys that start with `<path>/` will be copied. Note that you can especially give the empty string (`""`) as `<key>`, in which case all available telescope model data will be copied.

This is especially useful for serving telescope model data either partially or completely from storage. For instance:

```
$ ska-telmodel cp -UR "" tmdata
$ export SKA_TELMODEL_SOURCES=file://$(pwd)/tmdata
```

Would completely mirror the telescope model to the given location.

`ska_telmodel.cli.cmd_ls(args, data)`

List telescope model keys with a particular prefix

Usage:

```
ska-telmodel [-vUs<uris>] ls [<prefix>]
```

`ska_telmodel.cli.cmd_pin(args, data)`

Generates a “pinned” telescope model data source list, where all URIs replaced such that they will uniquely identify the contents of the telescope model data repository.

Usage:

```
ska-telmodel [-vUs<uris>] pin
```

After pinning, the source list precisely identifies the contents of the all telescope model data. For instance, this will replace GitLab URIs like `gitlab://gitlab.com/grp/proj#path` with `gitlab://gitlab.com/grp/proj?[commit]#path`, therefore baking in the exact commit referenced. You can set pinned sources in the environment as follows:

```
$ export $(ska-telmodel pin -U)
$ export $(ska-telmodel pin -US [custom sources])
```

This will especially prevent the `ska-telmodel` tool from infrequently (once a day) re-checking whether cached telescope model data contents is still current. The `-U` flag forces the cache refresh, which is generally a good idea before pinning.

`ska_telmodel.cli.cmd_validate(args, srcs)`

Validates given keys (or files) against applicable schemas from the telescope model library

Usage:

```
ska-telmodel [-vUs<uris>] validate [-tlR] [<key/path>]*
```

If `-R` is given, the key can be a key directory, in which all keys that start with `<path>/` will be copied. Note that you can especially give the empty string (`""`) as `<key>`, in which case all available telescope model data will be copied.

This is especially useful for serving telescope model data either partially or completely from storage. For instance:

```
$ ska-telmodel cp -R "" tmdata
$ export SKA_TELMODEL_SOURCES=file://$(pwd)/tmdata
```

Would completely mirror the telescope model to the given location.

1.6 Schema Development

The Telescope Model is developed jointly by all teams working on the SKA telescope. To make this work, all changes will have to be tested thoroughly and pass a code review via merge request.

Testing should ensure that all code paths are checked, i.e. we want to reach 100% coverage. We also aim to minimise regressions of any kind. This means that most code and data should be versioned *within* the Telescope Model, with old behaviour staying supported until a sufficient depreciation period has passed.

1.6.1 Adding a new schema (version)

To add a new interface, you will have to adjust a number of places in the library. For a new SKA interface `<interface>` with `<elem>` as the leading sub-system, do the following steps:

1. Add this:

```
<ELEM>_<INTERFACE>_PREFIX = "https://schema.skao.int/ska-<elem>-<interface>/"`
```

to `src/ska_telmodel/<elem>/version.py`. This is the interface namespace URI.

2. Add a `get_<elem>_<interface>_schema(version: str, strict: bool)` function to `src/ska_telmodel/<elem>/schema.py`, returning an appropriate Schema object. Consult <https://pypi.org/project/schema/> for how to write such schemas. Please add documentation as far as possible, this will be put both into the JSON schema as well as the documentation.
3. Adjust `schema_by_uri` in `src/ska_telmodel/schema.py` to call `get_<elem>_<interface>_schema` for schemas starting with `<ELEM>_<INTERFACE>_PREFIX` so that your schema can be found.
4. Add a documentation file `docs/src/ska_<elem>_<interface>.rst` with a line along the lines of

```
.. ska-schema:: https://schema.skao.int/ska-<elem>-<interface>/<ver>
```

to ensure documentation is generated

If you just want to add new schema version, skip steps (1) and (3) and extend existing definitions in the remaining steps.

1.6.2 Adding a new example

It is a good idea to always provide an up-to-date example for every schema version. Assuming the schema is defined, the steps are fairly similar:

1. Add a `get_<elem>_<interface>_example(version :str)` function to `src/ska_telmodel/<elem>/examples.py`, returning a dict. If you have multiple examples, you can add a `str` parameter to select the appropriate one.
2. Adjust `example_by_uri` in `src/ska_telmodel/schema.py` to call `get_<elem>_<interface>_example` for schemas starting with `<ELEM>_<INTERFACE>_PREFIX` so that your example can be found.
3. Add your example to `docs/src/ska_<elem>_<interface>.rst` by adding a line like

```
.. ska-schema-example:: https://schema.skao.int/ska-<elem>-<interface>/<ver>
```

inside the `.. ska-schema` block of the appropriate version

1.6.3 Last steps

1. Import the newly added `<ELEM>_<INTERFACE>_PREFIX` from `version`, `get_<elem>_<interface>_schema` from `schema` and `get_<elem>_<interface>_example` from `examples` into `src/ska_telmodel/<elem>/__init__.py` file.
2. Finally add tests in `test_<elem>_schemas.py` to ensure test coverage. This is especially easy if you add an example to the schema (see above sub-section).

1.6.4 Code Style

This project uses automated code formatting using the [Black Code Formatter](#), [isort](#) as well as custom [bowler refactoring rules](#).

To ensure that all code is formatted as required, run the following before you commit:

```
$ pip install black isort bowler # if needed
$ make python-format
```

1.7 Semantic Validation

1.7.1 Semantic vs Syntactic validations

Semantic validation and syntactic validation are two types of validation techniques used in software development to ensure that data entered into a system is accurate and conforms to the requirements of the system.

Syntactic validation checks the syntax of the input data and ensures that it adheres to the prescribed format. It checks whether the data entered is structured correctly and follows the expected syntax rules. For example, if an input field is supposed to accept only numerical data, a syntactic validation would ensure that only numerical characters are entered and reject any non-numeric characters.

Semantic validation, on the other hand, checks the meaning of the input data and ensures that it is valid in the context of the system. It checks whether the input data conforms to the business rules and logic of the system.

For example, if a system requires a date to be entered, a semantic validation would ensure that the date entered is valid, such as it's not a future date or a date that has already passed.

In summary, syntactic validation checks the structure of the data, while semantic validation checks the meaning of the data. Both types of validation are important to ensure the accuracy and integrity of data entered into a system.

1.7.2 Introduction

Here we have created 'Framework for semantic validation of observing setups'. This framework provides semantic validation which helps to prevent the users from making errors in their setups. This framework is supporting both MID and LOW schema validation as well as Scheduling Block(MID).

For creating this framework there are some requirements and architecture have already provided. These are as follows:

- [Configuration Schemas \(Mid\)](#)
- [Configuration Schemas \(Low\)](#)
- [Semantic Validation architecture AA0.5](#)

1.7.3 JSON validator file

Three separate JSON files have been created for Mid, Low and Scheduling Block Definition (MID) schemas to store all the parameters present in assign & configure resources along with its business rules and errors.

- [Reference of JSON validator file \(Mid\)](#)
- [Reference of JSON validator file \(Low\)](#)
- [Reference of JSON validator file \(SBD\)](#)

Created a separate constant file to maintain all telvalidation constant. From there we are importing JSON validator file in `semantic_validator` for Mid, Low as well as Scheduling Block Definition (MID) schemas.

Below are the commands to import JSON validator files.

```
from ska_telmodel.data import TMDData

from .constant import (
    LOW_VALIDATION_CONSTANT_JSON_FILE_PATH,
    MID_VALIDATION_CONSTANT_JSON_FILE_PATH,
    SBD_VALIDATION_CONSTANT_JSON_FILE_PATH,
)
```

Created a method that accepts 'interface' as parameter. Inside that there is a dictionary named 'validation_constants' which have 'key' (low, mid, sbd) and value pair. Based on the key provided it will return JSON path as 'value'.

```
def get_validation_data(interface: str):

    """
    :param interface: interface uri from the config.
    """
    validation_constants = {
        "low": LOW_VALIDATION_CONSTANT_JSON_FILE_PATH,
        "mid": MID_VALIDATION_CONSTANT_JSON_FILE_PATH,
        "sbd": SBD_VALIDATION_CONSTANT_JSON_FILE_PATH,
    }

    for key, value in validation_constants.items():
```

(continues on next page)

(continued from previous page)

```

    if key in interface:
        return value
# taking mid interface as default cause there is no any specific
# key to differentiate the interface
return MID_VALIDATION_CONSTANT_JSON_FILE_PATH

```

1.7.4 Adding a new parameter in JSON validator file

Steps to add a new parameter in JSON validator file

- **Locate the appropriate place in the JSON structure:**
 - Identify the parent key or object where the new parameter should be added.
 - Determine the desired position for the new parameter within the parent key's object.
- **Add a new key-value pair representing the parameter:**
 - Structure of parameter should be parent-child.
 - Specify the name of the parameter as the key, this key represents the parent_key and it should contain dictionary.
 - Add additional key-value pairs within the parent_key object for the rule and error message. In this you can specify the business rule & error message to validate the specific key.

Example

If a user wants to add any new parameter in JSON validator file so he can take reference of this example:

```

"scan": {
    "tmc": {
        "scan_id": [
            {
                "rule": "scan_id == 1",
                "error": "Invalid input for scan_id"
            }
        ]
    }
},

```

Let's take scan command as a dummy key which is currently not present in the JSON file.

Here under scan there is a dictionary which has a key named "tmc" so scan.tmc will be the parent_key and under tmc we have a "scan_id" child key containing a list which should contain appropriate rules and error messages.

1.7.5 General structure

This framework has created very dynamically and user friendly. If user wants to access this framework from CDM or Jupyter Notebook then he just has to import telvalidation package from import statement and call `semantic_validate` function and pass the appropriate parameters to this function. If validation fails then the end user will get the list of errors.

This framework can be access by below command:

```
from ska_telmodel.telvalidation.semantic_validator import semantic_validate
```

- Location of this framework

There are some steps of this framework these are as follows:

- **Step 1**

It checks the parameter in the JSON validator document which is present in tmdata package.

- **Step 2**

There is a `validate_json` function which takes two parameters JSON file & config as a dictionary. It is present in `src/ska_telmodel/telvalidation/oet_tmc_validators`. Here we are using an eval term to evaluate the business rules present in the JSON file and based on that it raises custom errors. All the custom errors are stored in a list named `error_msg_list`. At the end this function returns a list containing all the error messages.

```
ska_telmodel.telvalidation.oet_tmc_validators.validate_json(semantic_validate_constant_json:
dict, com-
mand_input_json_config:
dict, error_msg_list: list,
parent_key: str,
capabilities: dict) → list
```

This function is written to matching key's from user input command and validation constant rules those and present in mid, low and SBD validation constant json. e.g consider one of the assign resource command dish rule from constant json. here we are just mapping rule dish of receptor_ids to user assign resource command input payload. :param semantic_validate_constant_json: json containing all the parameters along with its business semantic validation rules and error message. :param command_input_json_config: dictionary containing details of the command input which needs validation. This is same as for `ska_telmodel.schema.validate`. :param parent_key: temp key to store parent key, means if same semantic validation key present in 2 places this will help to identify correct parent. :param capabilities: defined key, value structure pair from OSD API :returns: `error_msg_list`: list containing all combined error which arises due to semantic validation.

- **Step 3**

There is one more function `semantic_validate` which takes argument as `observing_command_input`, `tm_data`, `osd_data`, `interface`, `array_assembly` and `raise_semantic`. It is present in `src/ska_telmodel/telvalidation/schema`.

This function first checks for the interface, if the interface is not present then a warning message is logged, indicating that the `interface` is missing from the config. Additionally, a `SchematicValidationError` exception is raised with the same message.

This framework allowed interface only for two commands that are `assignresources` & `configure`. If a user provides an incorrect or unsupported interface value, for example if user passes the interface for the scan command, the code will not be able to find a matching validation schema based on that interface. As a result, the `validate_json` function will not be called, and the `msg_list` variable will remain empty.

Also this function is not supporting low telescope schema validation currently.

```

ska_telmodel.telvalidation.semantic_validator.semantic_validate(
    observing_command_input: dict, tm_data: TMDData,
    array_assembly: str = 'AA0.5', interface: Optional[str] =
    None,
    raise_semantic: bool = True, osd_data: Optional[dict] =
    None) → any

```

This method is entry point for semantic validation which can be consumed by other libraries like CDM. :param observing_command_input: dictionary containing details of the command which needs validation. This is same as for ska_telmodel.schema.validate. If command available as json string first convert to dictionary by json.loads. :param tm_data: telemodel tm data object using which we can load semantic validate json. :param osd_data: osd_data dict which passed externally :param interface: interface uri in full only provide if missing in observing_command_input :param array_assembly: Array assembly like AA0.5, AA0.1 :param raise_semantic: True(default) would need user to catch somewhere the SchematicValidationError. Set False to only log the error messages. :returns: msg: if semantic validation fail returns error message containing all combined error which arises else returns True.

1.7.6 Integration of OSD API into semantic validation

Integrated OSD capabilities into semantic validation rule file currently added support for mid-validation-contant. json file and sbd-validation-constants. json all the validation constraint are fetched from OSD API. * [Reference of OSD file](#)

Let's take one example There is function semantic_validate() which takes arguments as observing_command_input, tm_data, osd_data, array_assembly, interface and raise_semantic. It is present in src/ska_telmodel/telvalidation/schema. internally we call function get_osd_data() which takes mainly three arguments capabilities, array_assembly, tmdata object and validate command request against OSD capabilities configuration.

below is code sample to call semantic_validate()

- **scenario 1**

Import 'SchematicValidationError' from 'ska_telmodel' which contains all the customized error messages in string format.

```

from ska_telmodel.data import TMDData
from ska_telmodel.telvalidation.semantic_validator import
↳ SchematicValidationError
tmdata = TMDData()
try:
    semantic_validate(observing_command_input, tm_data, osd_data, array_
↳ assembly, interface, raise_semantic)
except SchematicValidationError as exc:
    raise exc

```

- **scenario 2**

If client wants to consume both OSD and semantic validation framework together for different scenarios in that case they can use both as specified below in the example. please note that in this scenario data get validated semantically with provided OSD version. If there is no version provided to the OSD call then data would get semantically validated with latest OSD configuration. e.g

```

from ska_telmodel.data import TMDData
from ska_telmodel.telvalidation.semantic_validator import ↪
    SchematicValidationError
from ska_telmodel.osd.osd import get_osd_data
osd_data = get_osd_data()
tmdata = TMDData()
try:
    semantic_validate(observing_command_input, tm_data, array_assembly, ↪
    interface, raise_semantic, osd_data)
except SchematicValidationError as exc:
    raise exc

```

| Parameters | Description |
|-------------------------|---|
| observing_command_input | dictionary containing details of command input which needs semantic validation. |
| tm_data | telemodel tm_data object using which we can load semantic validate json files. |
| array_assembly | Array assembly contains AA0.5 or AA0.1. |
| interface | interface uri in observing_command_input. |
| raise_semantic | True(default) would need user to catch somewhere the SchematicValidationError. |
| osd_data | osd_data which can be create at client side and passed externally |

1.7.7 How the rules are worked after get constraints values from OSD

Consider we are applying semantic validation rule on dish i.e length of receptor_ids <= 4. This constraints value 4 is fetched from OSD by referring key number_ska_dishes.

```

"dish": {
    "receptor_ids": [
        {
            "rule": "(0 < length(receptor_ids) <= number_ska_dishes)",
            "error": "receptor_ids are too many!Current Limit is {number_ska_
↪dishes}"
        }
    ]
},

```

1.7.8 Limitation

- 1
currently we are having directly dependency on OSD key's, means developer/Observatory scientist always needs to remember those constraints keys and put into rule files.
- 2
OSD version and semantic validation rule file version should be same.

if OSD keys got removed/changed and those are not in validation rule file it will raise SchemanticValdidationKeyError saying Invalid rule and error key passed

1.7.9 Target visibility validation

There are ra and dec parameters in configure resources, to validate these parameters we have created a separate module named `coordinates_conversion` which converts Right Ascension and Declination to Azimuth and Altitude. This module contains a function `ra_dec_to_az_el` which has logic for this conversion. This function has been imported in the `validate_target_is_visible` function which is present in the `oet_tmc_validators` module.

```
ska_telmodel.telvalidation.oet_tmc_validators.validate_target_is_visible(ra_str: str, dec_str: str, telescope: str, target_env: str, tm_data, observing_time: datetime = datetime(2024, 3, 21, 10, 31, 3, 443538)) → str
```

Check the target specific by ra,dec is visible during observing_time at telescope site

Parameters

- **ra_str** – string containing value of ra
- **dec_str** – string containing value of dec
- **telescope** – string containing name of the telescope
- **observing_time** – string containing value of observing_time
- **target_env** – string containing the environment value(mid/low) for the target
- **tm_data** – telemodel tm dataobject using which we can load semantic validate json.

This is the main function for conversion.

```
ska_telmodel.telvalidation.coordinates_conversion.ra_dec_to_az_el(telesc: str, ra: float, dec: float, obs_time: str, el_limit: float, tm_data: TMDData, time_format: str = 'iso', if_set: bool = False, time_scale: str = 'utc', coord_frame: str = 'icrs', prec: float = 0.0001, max_iter: int = 200) → list
```

Returns

the az el in degrees from ra dec at given time for the telescopes [az el info_isvisible]

Index 0

azimuth in degrees

Index 1

elevation in degrees

Index 2

info_isvisible is True if src visible above/at el_limit given time else False

Parameters

- **telesc** – “mid” for Mid or “low” for Low Telescope
- **ra** – Right ascension in degrees with decimal places for arc min,arc sec also covert to degrees. Eg 123d30’ input 123.5 . In case of RA in hh mm sec please also convert to degrees.

- **dec** – Declination in degrees with decimal places.
- **obs_time** – str containing time when source position in terms of azimuth, elevation should be calculated. Eg ‘2023-04-18 20:12:18’
- **time_format** – str to choose from available Time.FORMATS. Default “iso”
- **time_scale** – str to choose from available Time.SCALES Default “utc”
- **coord_frame** – str to choose from available Astronomical Coordinate Systems
- **el_limit** – float specifying elevation in degree below which our telescope cannot observe the source
- **prec** – float for precision limit in degrees to match elevation with given el_limit. default: 0.0001 degrees i.e. <1 arcsecond
- **max_iter** – int to specify upto how many iterations can root finder use before it stops or reaches required precision. Default is 200. Only set higher if suggested by message. There is also a separate message if it is determined that root finder is not able to converge starting from given time
- **tm_data** – telemodel tm data object using which we can load semantic validate json.

1.8 API reference

1.8.1 ska_telmodel.data

class ska_telmodel.data.TMData(*source_uris: Optional[list[str]] = None, prefix: str = "", update: bool = False, backend_pars: dict = {}*)

Represents a tree of telescope model data.

Data is retrieved from specified **sources** (or using default sources if not passed). Depending on backend, this might cause data to be loaded from remote locations, such as the SKAO central artefact repository or Gitlab.

Objects of this class provide a hierarchical dict/h5py-like interface. For instance, you can print all objects with keys starting with **instrument/layout** as follows:

```
layouts = tmdata['instrument/layout']
for key in layouts:
    print(f"Data for {key}: ", layouts[key].get())
```

This works because `__getitem__()` will redirect to `get_subtree()` or `get()` depending on whether a valid key is passed (i.e. it has an extension). The *TMObject* object can then be used to access the underlying telescope model data.

Parameters

- **source_uris** – List of telescope model data sources. If not passed, defaults to SKA_TELMODEL_SOURCES environment variable, then in-built DEFAULT_SOURCES.
- **prefix** – Key prefix for sub-tree selection
- **update** – Update cached data sources (if any)
- **backend_pars** – Extra parameters to specific backend (types)

get(key: *str*) → *TMObject*

Returns the telescope model object with the given key

Parameters

key – Key to retrieve. Must be a valid telescope model key (i.e. have a file type extension)

Returns

TMObject object

Raises

KeyError if object doesn't exist

get_sources(pinned: *bool* = *False*) → list[*str*]

Returns list of source URIs

Parameters

pinned – Attempt to return URIs that will continue to refer to this specific version of telescope model data. E.g. for GitLab URIs, this replaces tags or branches by the concrete commit hash.

Returns

list of sources

get_subtree(prefix: *str*) → *TMDData*

Returns clone of *TMDData* object with given prefix

Note that no checking is done whether any keys with the given prefix exist.

Parameters

prefix – Prefix to narrow scope to. Must be a valid telescope model prefix

Returns

TMDData object using prefix

class ska_telmodel.data.**TMObject**(source: *TMDDataBackend*, key: *str*)

Represents a telescope model data object. Provides a number of ways to access the data.

Parameters

- **source** – Backend to use to retrieve object data
- **key** – Key associated with object

copy(dest: *str*)

Copy object data to a file.

Parameters

dest – Path of destination file

get() → bytes

Access data at given key as raw bytes

Returns

Raw object data

get_dict(**kwargs) → dict

Access object as a dictionary

Will only work if the key ends with a known extension – e.g. .json or .yaml.

Parameters

kwargs – Extra parameters to [json/yaml].load

Returns

Parsed dictionary

`open()` → `IO[bytes]`

Access object data as a read-only file object

Parameters

key – Key to query

Returns

File-like object

1.8.2 ska_telmodel.schema

Support for validating and generating examples for SKA telescope model schemas.

`class ska_telmodel.schema.SchemaUri(version: str)`

Convenience class for manipulating version URIs.

Parameters

version – Interface URI

property major_minor: `Tuple[int, int]`

Get the major and minor parts of the version.

Returns

tuple of major and minor versions

property prefix: `str`

Get the prefix.

Returns

prefix

property version: `str`

Get the version.

Returns

version

`ska_telmodel.schema.example_by_uri(version: str, *args) → dict`

Generates an example for a particular schema

Parameters

- **version** – Interface URI
- **args** – Extra parameters depending on interface (strings)

Returns

Dictionary

`ska_telmodel.schema.schema_by_uri(version: str, strict: int = 1, **kwargs) → Schema`

Looks up interface schema based on interface identifier

Parameters

- **version** – Interface URI
- **strict** – Strictness level

Returns

Interface schema

`ska_telmodel.schema.validate(version: Optional[str], config: dict, strictness: int = 1)`

Validate a dictionary against schema

Will automatically determine the schema to check against

Parameters

- **version** – Interface with version
- **config** – Dictionary to validate
- **strictness** – Strictness level (0: permissive warnings, 1: permissive errors + strict warnings, 2: strict errors).

Note that with strictness level 2, a lot of generally harmless schema violations will cause an exception to be raised. This is generally inadvisable in production consumer code (“be liberal in what you accept”).

Raises

SchemaError – Raised if the object fails permissive checks at strictness level 1. At strictness level 2, raised if the object fails any schema check.

1.9 Internals

1.9.1 ska_telmodel_common

`class ska_telmodel._common.TMSchema(schema: Optional[Any] = None, error=None, ignore_extra_keys: bool = False, name: Optional[str] = None, description: Optional[str] = None, as_reference: bool = False, version: Optional[str] = None, strict: bool = False)`

Wrapper on top of schema.Schema for incremental schema build-up.

`ska_telmodel._common.get_unique_id_schema(strict: bool, type_re: str = '[a-z0-9]+')` → Schema

Return schema for unique identifier.

Parameters

type_re – Restricts ID type(s) to accept.

`ska_telmodel._common.interface_uri(prefix: str, *versions: int)` → *str*

Make an URI from the given prefix and versions

Parameters

- **prefix** – Schema URI prefix. Must end in ‘/’
- **versions** – Components of the version

`ska_telmodel._common.mk_if(cond: bool)` → Callable[[*Any*, *Any*]

Generate schema combinator to conditionally activate a part.

`ska_telmodel._common.split_interface_version(version: str)` → Tuple[int, int]

Extracts version number from interface URI

Parameters

version – Version string

Returns

(major version, minor version) tuple

1.9.2 ska_telmodel.channel_map

Tools for working with JSON compressed channel maps.

The SKA is meant to have a large number of channels, which means that any type of per-channel configuration might become very cumbersome to transfer and reason about. To prevent such issues we are using a simple run-length encoding to “compress” the representation. The idea is that if we write:

```
[ [0,0], [200,1], [400, 3] ]
```

We essentially mean the dictionary:

```
{ 0: 0, 1: 0, ..., 199:0, 200:1, ..., 399:1, 400: 3, ...}
```

Furthermore runs of numbers are supported, by adding an increment:

```
[ [0,0,1], [200,1] ]
```

Means:

```
{ 0: 0, 1: 1, 2:2, ..., 199:100, 200:1, ...}
```

`ska_telmodel.channel_map.channel_map_at(channel_map: List[list], channel: int, make_entry: bool = False) → Any`

Query a value from a channel map

Parameters

- **channel_map** – Queried map
- **channel** – Channel ID to query
- **make_entry** – Return an channel map entry (including increment) instead of just the value

Returns

Value from map

`ska_telmodel.channel_map.shift_channel_map(channel_map: List[list], channel_shift: int) → List[list]`

Shift a channel map by some channel distance

Parameters

- **channel_map** – Channel map to use
- **channel_shift** – Shift to apply

`ska_telmodel.channel_map.split_channel_map(channel_map: List[list], first_channel: int, channel_group_steps: int, rebase_groups: Optional[int] = None, minimum_groups: int = 0) → List[List[list]]`

Split a channel map using a constant channel step length

Parameters

- **channel_map** – Channel map to split. Each entry is expected to have the start channel in the first field, and mapped data in the remaining entries
- **first_channel** – First channel to appear in the map

- **channel_group_steps** – Chunks to split the channel map into
- **rebase_groups** – Start every group at given channel index (None: left as-is)
- **minimum_groups** – Minimum number of groups to return

Returns

List of channel maps

```
ska_telmodel.channel_map.split_channel_map_at(channel_map: List[list], channel_groups: List[int],
                                              rebase_groups: Optional[int] = None) → List[List[list]]
```

Split a channel map at certain points

Parameters

- **channel_map** – Channel map to split. Each entry is expected to have the start channel in the first field, and mapped data in the remaining entries
- **channel_groups** – Boundaries between channel groups. The n -th returned channel map will cover channels $channel_groups[n]..channel_groups[n+1]-1$. Needs to have at least two entries.
- **rebase_groups** – Start every group at given channel index (None: left as-is)

Returns

List of channel maps

1.9.3 ska_telmodel.data

class ska_telmodel.data.backend.CARBackend(uri: str, *args, **kwargs)

Represents data in (a mirror of) the SKA central artefact repository. Permissible URI formats:

```
car:[project name]?[branch]#[directory]
car://[gitlab server]/[project name]?[branch]#[directory]
```

So for instance:

```
car:ska-telmodel?master
car://gitlab.com/ska-telescope/ska-telmodel?master#tmdata
```

The source of truth might still be Gitlab, yet this backend will only work with artefacts that have been uploaded to the CAR. The short form URI will be expanded into the long form automatically.

classmethod backend_name() → str

Returns the name of the backend.

Will be used for the scheme in URIs to identify the backend type of a telescope model data source.

get_uri(pinned: bool) → str

Returns URI for this telescope model data backend

Parameters

pinned – Attempt to return an URI that will continue to refer to this specific version of telescope model data

Returns

URI identifying data source

class `ska_telmodel.data.backend.FilesystemBackend(uri: str, update: bool = False)`

Retrieves data from a locally accessible file system. URI format:

`file://[absolute path]`

Note that changes to the file system are outside of our control. Consistency must be ensured externally.

classmethod `backend_name() → str`

Returns the name of the backend.

Will be used for the scheme in URIs to identify the backend type of a telescope model data source.

copy(key: *str*, dest: *str*)

Write key contents to a file.

Raises *KeyError* if the key does not exist

Parameters

- **key** – Key to query
- **dest** – Path of destination file

exists(key: *str*) → *bool*

Check whether a given key exists.

Parameters

- key** – Key to query

Returns

True if key exists

get(key: *str*) → *bytes*

Get the data stored with the given key

Parameters

- key** – Key to query

Returns

Bytes stored at key

get_uri(pinned: *bool*) → *str*

Returns URI for this telescope model data backend

Parameters

- pinned** – Attempt to return an URI that will continue to refer to this specific version of telescope model data

Returns

URI identifying data source

list_keys(key_prefix: *str* = "") → *Iterable*[*str*]

List children keys

Yields all keys with prefix "{key_prefix}/" in ascending order

Parameters

- key_prefix** – Path to query

open(key: *str*, binary: *bool* = *True*) → *IO*[*bytes*]

Access data at given key as a file-like object

Raises *KeyError* if the key does not exist

Parameters

key – Key to query

```
class ska_telmodel.data.backend.GitlabBackend(uri: str, update: bool = False, gl: gitlab.Gitlab = None,
                                              try_nexus: bool = True, nexus_url: str = None,
                                              env=None)
```

Represents data in a GitLab repository. URI format:

```
gitlab://[gitlab server]/[project name]?[branch]#[directory]
```

So for instance:

```
gitlab://gitlab.com/ska-telescope/ska-telmodel?master#tmdata
```

Would refer to data contained in the `ska-telmodel` repository itself.

Repositories accessed in this way should make sure to activate the `tmdata` standard continuous integration stages (see <https://gitlab.com/ska-telescope/templates-repository>) to ensure that telescope model data is cached in the SKAO central artefact repository. Once that has been done, this library will never actually query GitLab directly.

Furthermore, this backend will cache all loaded data locally, including resolved Gitlab references (like `master` in the example above). This especially means that once instantiated, the version of data will be “pinned” even between different instances (and processes). Use the `update` parameter to `ska_telmodel.data.TMData` or `GitlabBackend` respectively to refresh the local cache.

classmethod `backend_name()` → `str`

Returns the name of the backend.

Will be used for the scheme in URIs to identify the backend type of a telescope model data source.

copy(*key*: `str`, *dest*: `str`)

Write key contents to a file.

Raises `KeyError` if the key does not exist

Parameters

- **key** – Key to query
- **dest** – Path of destination file

exists(*key*: `str`) → `bytes`

Check whether a given key exists.

Parameters

key – Key to query

Returns

True if key exists

get(*key*: `str`) → `bytes`

Get the data stored with the given key

Parameters

key – Key to query

Returns

Data stored at key, or None if it doesn't exist

get_uri(*pinned*: *bool*) → *str*

Returns URI for this telescope model data backend

Parameters

pinned – Attempt to return an URI that will continue to refer to this specific version of telescope model data

Returns

URI identifying data source

list_keys(*key_prefix*: *str* = "") → *Iterable*[*str*]

List children keys

Yields all keys with prefix “{key_prefix}/” in ascending order. Exception is if the path is empty, in which case all available keys are listed.

Parameters

key_prefix – Path to query

open(*key*: *str*) → *IO*[*bytes*]

Access data at given key as a file-like object

Raises *KeyError* if the key does not exist

Parameters

key – Key to query

class *ska_telmodel.data.backend.MemoryBackend*(*uri*: *str*, *update*: *bool* = *False*)

Represents in-memory data. URIs should look as follows:

mem:///?[key1]=[value1]&[key2]=[value2]

This will directly set the given telescope model data keys to the given values. Useful for testing, and overriding single values in telescope model data.

classmethod **backend_name**() → *str*

Returns the name of the backend.

Will be used for the scheme in URIs to identify the backend type of a telescope model data source.

get(*key*: *str*) → *bytes*

Get the data stored with the given key

Parameters

key – Key to query

Returns

Bytes stored at key

get_uri(*pinned*: *bool*) → *str*

Returns URI for this telescope model data backend

Parameters

pinned – Attempt to return an URI that will continue to refer to this specific version of telescope model data

Returns

URI identifying data source

list_keys(key_prefix: *str* = "") → *Iterable*[*str*]

List children keys

Yields all keys with prefix "{key_prefix}/" in ascending order

Parameters

key_prefix – Path to query

class ska_telmodel.data.backend.TMDataBackend(*uri*: *str*, *update*: *bool* = *False*)

Base class for telescope model data backends

Sub-classes should override *backend_name()*, then utilise *telmodel_backend()* to register the telescope model data backend. A minimal implementation should furthermore provide *list_keys()* and *get()*.

abstract classmethod *backend_name()* → *str*

Returns the name of the backend.

Will be used for the scheme in URIs to identify the backend type of a telescope model data source.

copy(*key*: *str*, *dest*: *str*)

Write key contents to a file.

Raises *KeyError* if the key does not exist

Parameters

- **key** – Key to query
- **dest** – Path of destination file

exists(*key*: *str*) → *bool*

Check whether a given key exists.

Parameters

key – Key to query

Returns

True if key exists

abstract *get*(*key*: *str*) → *bytes*

Get the data stored with the given key

Parameters

key – Key to query

Returns

Data stored at key, or None if it doesn't exist

get_uri(*pinned*: *bool*) → *str*

Returns URI for this telescope model data backend

Parameters

pinned – Attempt to return an URI that will continue to refer to this specific version of telescope model data

Returns

URI identifying data source

abstract *list_keys*(key_prefix: *str* = "") → *Iterable*[*str*]

List children keys

Yields all keys with prefix "{key_prefix}/" in ascending order. Exception is if the path is empty, in which case all available keys are listed.

Parameters

key_prefix – Path to query

open(key: *str*) → IO[bytes]

Access data at given key as a file-like object

Raises *KeyError* if the key does not exist

Parameters

key – Key to query

classmethod valid_key(key: *str*) → bool

Check whether this is a valid key we could store data for

For this to be valid, it needs to: * Have every path segment start with a letter * Have no dot in directory names, and a dot in file name

Returns

Validity of key

classmethod valid_prefix(key: *str*) → bool

Check whether argument could be a valid prefix to a key

For this to be valid, it needs to: * Have every path segment start with a letter * Have no dot in directory names, and a dot in file name

Returns

Validity of key

1.9.4 ska_telmodel.csp

`ska_telmodel.csp.config.add_midcbf_visibility_receive_addresses(csp_config: dict, scan_receive_addrs: dict, csp_interface_version: str, sdp_interface_version: str) → dict`

Add SDP visibility receive addresses into mid-cbf configuration

Parameters

- **csp_config** – CSP input configuration
- **scan_receive_addrs** – SDP receive addresses for scan
- **csp_interface_version** – CSP interface version to assume
- **sdp_interface_version** – SDP interface version to assume

Returns

New CSP configuration

`ska_telmodel.csp.config.add_pss_receive_addresses(csp_config: dict, scan_receive_addrs: dict, csp_interface_version: str, sdp_interface_version: str) → dict`

Add SDP visibility receive addresses into pulsar search configuration

Parameters

- **csp_config** – CSP input configuration
- **scan_receive_addrs** – SDP receive addresses for scan

- **csp_interface_version** – CSP interface version to assume
- **sdp_interface_version** – SDP interface version to assume

Returns

New CSP configuration

```
ska_telmodel.csp.config.add_pst_receive_addresses(csp_config: dict, scan_receive_addrs: dict,
                                                  csp_interface_version: str, sdp_interface_version:
                                                  str) → dict
```

Add SDP visibility receive addresses into pulsar timing configuration

Parameters

- **scan_type** – Scan type executed
- **csp_config** – CSP input configuration
- **sdp_receive_addrs** – SDP receive addresses for scan

Returns

New CSP configuration

```
ska_telmodel.csp.config.add_receive_addresses(scan_type: str, csp_config: dict, scan_receive_addrs:
                                              dict, csp_interface_version: str, sdp_interface_version:
                                              str) → dict
```

Add SDP visibility receive addresses into CSP configuration

Parameters

- **csp_config** – CSP input configuration
- **scan_receive_addrs** – SDP receive addresses for scan
- **csp_interface_version** – CSP interface version to assume
- **sdp_interface_version** – SDP interface version to assume

Returns

New CSP configuration

```
ska_telmodel.csp.config.get_fsp_channel_offset(csp_config_in: dict) → int
```

Determines first channel ID within an FSP

```
ska_telmodel.csp.config.get_fsp_output_channel_offset(fsp_config: dict, fsp_id: str, fsp_ch_offset:
                                                      str) → int
```

Determines the FSP channel offset. Either read from the dictionary or reconstructed.

Parameters

- **fsp_config** – FSP configuration structure
- **fsp_id** – Position of FSP in configuration
- **fsp_ch_offset** – Name of FSP channel offset field

```
ska_telmodel.csp.examples.get_csp_assignresources_example(version: str) → dict
```

Generate example of CSP assignresources argument

Parameters

version – Version URI of configuration format

`ska_telmodel.csp.examples.get_csp_config_example(version: str, scan: Optional[str] = None) → dict`

Generate examples for CSP configuration strings

Parameters

- **version** – Version URI of configuration format
- **scan** – Includes SDP receive addresses for a scan? *None* means that this is “template” configuration as passed to TMC. Valid parameters: `cal_a`, `science_a`

`ska_telmodel.csp.examples.get_csp_delaymodel_example(version: str) → dict`

Generate example of CSP delay model argument

Parameters

version – Version URI of configuration format

`ska_telmodel.csp.examples.get_csp_endscan_example(version: str) → dict`

Generate example of CSP endscan argument

Parameters

version – Version URI of configuration format

`ska_telmodel.csp.examples.get_csp_low_delaymodel_example(version: str) → dict`

Generate example of CSP low delay model argument

Parameters

version – Version URI of configuration format

`ska_telmodel.csp.examples.get_csp_releaseresources_example(version: str) → dict`

Generate example of CSP releaseresources argument

Parameters

version – Version URI of configuration format

`ska_telmodel.csp.examples.get_csp_scan_example(version: str) → dict`

Generate example of CSP scan argument

Parameters

version – Version URI of configuration format

Interface module for generating CSP configuration.

Handles parsing and validation of inputs and passes them on to the internal configuration functions in `config`.

`ska_telmodel.csp.interface.make_csp_config(csp_interface_version: str, sdp_interface_version: str, scan_type: str, csp_config_str: Union[str, dict], sdp_receive_addrs_map_str: Union[str, dict]) → str`

Generate CSP scan configuration for a scan using SDP receive addresses.

This should be used right before CSP is configured so that data streams are sent to the right ingest nodes.

Parameters

- **csp_interface_version** – Version of CSP interface (URI)
- **sdp_interface_version** – Version of SDP interface (URI)
- **scan_type** – Type of scan to configure
- **csp_config_in** – General CSP configuration
- **sdp_receive_addrs** – Receive addresses map for scan types, generated by SDP

Returns

A validated JSON string with CSP configuration.

Raise

ValueError when the input JSON configuration fails validation.

Used for checking CSP configuration strings for conformance

`ska_telmodel.csp.schema.get_cbf_config_schema(version: str, strict: bool)` → Schema

Correlator and Beamformer configuration schema

Parameters

- **version** – Interface Version URI
- **strict** – Schema strictness

Returns

the JSON Schema for the MID.CBF configuration.

`ska_telmodel.csp.schema.get_common_config_schema(version: str, strict: bool)` → Schema

CSP Subarray common configuration schema. This section is valid for Mid CSP because it includes some parameters that are Mid CBF specific. The set of parameters that are common to Mid and Low CSP, are retrieved by the `_get_common_config_schema` method defined in the `common_schema` python module.

Parameters

- **version** – Interface Version URI
- **strict** – Schema strictness

Returns

the JSON Schema for the CSP subarray common configuration (ADR-18).

`ska_telmodel.csp.schema.get_csp_assignresources_schema(version: str, strict: bool)` → Schema

Returns the schema to verify the CSP assignresources command.

Parameters

- **version** – Interface version URI
- **strict** – Strict mode. If true, refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the command.

Raise

ValueError exception on invalid JSON Schema URI.

`ska_telmodel.csp.schema.get_csp_config_schema(version: str, strict: bool)` → Schema

Returns a schema to verify a CSP configuration

Parameters

- **version** – Interface version
- **strict** – Strict mode - refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the CSP configuration.

Raise

ValueError exception on mismatch major version or invalid JSON Schema URI

`ska_telmodel.csp.schema.get_csp_delay_details_schema(version: str, strict: bool)` → Schema

Returns the schema with the CSP delay details

Parameters

- **version** – Interface version URI
- **strict** – Strict mode. If true, refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the command.

Raise

ValueError exception on invalid JSON Schema URI.

`ska_telmodel.csp.schema.get_csp_delaymodel_schema(version: str, strict: bool)` → Schema

Returns the schema to verify the CSP delaymodel command.

Parameters

- **version** – Interface version URI
- **strict** – Strict mode. If true, refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the command.

Raise

ValueError exception on invalid JSON Schema URI.

`ska_telmodel.csp.schema.get_csp_endscan_schema(version: str, strict: bool)` → Schema

Returns the schema to verify the CSP endscan command.

Parameters

- **version** – Interface version URI
- **strict** – Strict mode. If true, refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the command.

Raise

ValueError exception on invalid JSON Schema URI.

`ska_telmodel.csp.schema.get_csp_low_delaymodel_schema(version: str, strict: bool)` → Schema

Returns the schema to verify the CSP low delaymodel command.

Parameters

- **version** – Interface version URI
- **strict** – Strict mode. If true, refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the command.

Raise

ValueError exception on invalid JSON Schema URI.

`ska_telmodel.csp.schema.get_csp_poly_info_schema(version: str, strict: bool) → Schema`

Returns the schema with the CSP delay details

Parameters

- **version** – Interface version URI
- **strict** – Strict mode. If true, refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the command.

Raise

ValueError exception on invalid JSON Schema URI.

`ska_telmodel.csp.schema.get_csp_releaseresources_schema(version: str, strict: bool) → Schema`

Returns the schema to verify the CSP releaseresources command.

Parameters

- **version** – Interface version URI
- **strict** – Strict mode. If true, refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the command.

Raise

ValueError exception on invalid JSON Schema URI.

`ska_telmodel.csp.schema.get_csp_scan_schema(version: str, strict: bool) → Schema`

Returns the schema to verify the CSP scan command.

Parameters

- **version** – Interface version URI
- **strict** – Strict mode. If true, refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the command.

Raise

ValueError exception on invalid JSON Schema URI.

`ska_telmodel.csp.schema.get_fsp_config_schema(version: str, strict: bool)`

Frequency slice processor configuration schema

Parameters

- **version** – Interface Version URI
- **strict** – Schema strictness

Returns

the JSON schema for the MID.CBF FSP configuration.

`ska_telmodel.csp.schema.get_low_csp_station_beam_details_schema(version: str, strict: bool) → Schema`

Returns the schema with the Low CSP delay details

Parameters

- **version** – Interface version URI
- **strict** – Strict mode. If true, refuse even harmless schema violations (like extra keys). DO NOT USE FOR INPUT VALIDATION!

Returns

The JSON Schema for the command.

Raise

ValueError exception on invalid JSON Schema URI.

`ska_telmodel.csp.schema.get_search_window_config_schema(version: str, strict: bool)` → Schema
SearchWindow configuration schema

Parameters

- **version** – Interface Version URI
- **strict** – Schema strictness

Returns

the JSON Schema for the MID.CBF SearchWindow configuration.

`ska_telmodel.csp.schema.get_subarray_config_schema(version: str, strict: bool)` → Schema
CSP Subarray configuration schema

Parameters

- **version** – Interface Version URI
- **strict** – Schema strictness

Returns

the JSON Schema for the CSP subarray specific configuraiton.

`ska_telmodel.csp.schema.get_vlbi_config_schema(version: str, strict: bool)`
VLBI specific items

Parameters

- **version** – Interface Version URI
- **strict** – Schema strictness

Returns

the JSON schema for the MID.CBF VLBI configuration.

csp.validators module defines constants and functions for validating CSP fields in schemas.

`ska_telmodel.csp.validators.validate_integration_factor(integration_factor: int)` → *bool*
Checks if the integration_factor is valid.

Parameters

integration_factor – Integration time for correlation products

Returns

True if integration_factor is valid

```
ska_telmodel.csp.version.check_csp_interface_version(version: str, allowed_prefixes: Union[str,
List[str]] = ['https://schema.skao.int/ska-csp-assignresources/',
'https://schema.skao.int/ska-csp-configure/',
'https://schema.skao.int/ska-csp-scan/',
'https://schema.skao.int/ska-csp-endscan/',
'https://schema.skao.int/ska-csp-releaseresources/',
'https://schema.skao.int/ska-csp-delaymodel/',
'https://schema.skao.int/ska-low-csp-delaymodel/']) → str
```

Check CSP interface version.

Checks that the interface URI has one of the allowed prefixes. If it does, the version number is returned. If not, a ValueError exception is raised.

Parameters

- **version** – CSP interface URI
- **allowed_prefixes** – allowed URI prefix(es)

Returns

version number

```
ska_telmodel.csp.version.csp_config_versions(min_ver=None, max_ver=None)
```

Returns a list of CSP configuration interface version URIs

Parameters

- **min_ver** – Tuple of minimum version to return
- **max_ver** – Tuple of maximum version to return

```
ska_telmodel.csp.version.normalize_csp_config_version(csp_interface_version: Union[int, str],
csp_config: Optional[dict] = None)
```

Provides a standard interface version for configure

Parameters

- **csp_interface_version** – External guess at the interface version
- **csp_config** – Example configuration to derive version from

Returns

Canonical URI of interface version

1.9.5 ska_telmodel.sdp

Define schemas for SDP commands.

Miscellaneous schemas that probably should be moved somewhere else.

```
ska_telmodel.sdp.common.ALL_RECEPTORS =
Or(Regex('^C([1-9]|[1-9][0-9]|1[0-9][0-9]|2[0-1][0-9]|22[0-4])$'),
Regex('^A[ENS]([1-9]|1[0-6])-[1-6]$'),
Regex('^FS([1-9]|[1-9][0-9]|1[4][0-9][0-9]|50[0-9]|51[0-2])(\\.\\S+)?$'),
Regex('^SKA(?!000)0[0-9][0-9]|1[0-2][0-9]|13[0-3])$'),
Regex('^MKT0([0-5][0-9]|6[0-3])$'))
```

All receptors.

```
ska_telmodel.sdp.common.LOW_CORE =
Regex('^C([1-9]|[1-9][0-9]|1[0-9][0-9]|2[0-1][0-9]|22[0-4])$')
```

LOW core receptors, 1-224

```
ska_telmodel.sdp.common.LOW_DIRS = Regex('^ENS([1-9]|1[0-6])-[1-6]$')
```

LOW east/north/south receptors.

```
ska_telmodel.sdp.common.LOW_FS =
Regex('^FS([1-9]|[1-9][0-9]|1[4][0-9][0-9]|50[0-9]|51[0-2])(\\.\\.\\S+)?$')
```

LOW FS 1-512, plus optional substations.

```
ska_telmodel.sdp.common.MID_MKT = Regex('^MKT0([0-5][0-9]|6[0-3])$')
```

MID Meerkat, 000-063.

```
ska_telmodel.sdp.common.MID_SKA = Regex('^SKA((?!000)0[0-9][0-9]|1[0-2][0-9]|13[0-3])$')
```

MID SKA, 001-133.

```
ska_telmodel.sdp.common.get_beam_function_pattern(strict: bool)
```

Get pattern for SDP beam functions

As used for SDP configuration - i.e. basically a kind of data that the SKA SDP needs to receive.

Returns

A string pattern suitable for use in schemas

```
ska_telmodel.sdp.common.get_receptor_schema(strict: bool) → Schema
```

Return schema for receptors.

Parameters

strict – check names if set

Returns

schema

```
ska_telmodel.sdp.examples.get_sdp_assignres_example(version: Union[int, str]) → dict
```

Generate example of SDP assign resources argument.

Parameters

version – SDP assign resources version

Returns

Example dictionary

```
ska_telmodel.sdp.examples.get_sdp_configure_example(version: Union[int, str], scan_type: str =
'science') → dict
```

Generate example of SDP configure argument.

Parameters

- **version** – SDP configure version
- **scan_type** – Scan type to configure. “new_calibration” declares a new scan in-line.

Returns

Example dictionary

```
ska_telmodel.sdp.examples.get_sdp_recvaddrs_example(version: Union[int, str]) → dict
```

Generate example of SDP receive addresses map.

Parameters

version – SDP receive addresses version

Returns

Example dictionary

`ska_telmodel.sdp.examples.get_sdp_releaseres_example(version: Union[int, str]) → dict`

Generate example of SDP release resources argument.

Parameters

version – SDP release resources version

Returns

Example dictionary

`ska_telmodel.sdp.examples.get_sdp_scan_example(version: Union[int, str], scan_id: int = 1) → dict`

Generate example of SDP scan argument.

Parameters

- **version** – SDP scan version
- **scan_id** – Scan ID to start

Returns

Example dictionary

Define processing blocks schemas.

Defines receive addresses schema.

Used for checking SDP strings for conformance.

`ska_telmodel.sdp.version.CALL_SIG`

Call signature for schemas.

alias of `Callable[[Union[int, str], bool], Schema]`

`ska_telmodel.sdp.version.PREFIXES_TYPE`

The type af allowed prefixes.

alias of `Union[str, Sequence[str]]`

class `ska_telmodel.sdp.version.SchemaFactory`(*prefix: Optional[str] = None, allowed_prefixes: Optional[Union[str, Sequence[str]]] = None*)

Get the right schema for a type based on its version.

get_schema(*version: SdpVersion, strict: bool*) → Schema

Get the schema for this version.

If strict, an exact match is required. Otherwise, the last minor version matching the major version is accepted. It is assumed that a version is of the form version.subversion.

Parameters

- **version** – SDP version object
- **strict** – whether strict or not

Returns

the matching schema

register(*version: str, func: Callable[[*Union[int, str]*, *bool*], Schema]*) → None

Register a function to create the schema.

Parameters

- **version** – the short version number (not the URI).

- **func** – function to create the schema

register_all(versions: *Iterable[str]*, func: *Callable[[Union[int, str], bool], Schema]*) → *None*

Register a function to create the schema for multiple versions.

Parameters

- **versions** – iterable of short version numbers (not the URIs).
- **func** – function to create the schema

class ska_telmodel.sdp.version.**SdpVersion**(version: *Union[int, str]*, prefix: *Optional[str] = None*,
allowed_prefixes: *Optional[Union[str, Sequence[str]]] = None*)

Wrapper around the normalise/check functions and stores the results.

Parameters

- **version** – SDP interface version
- **prefix** – schema prefix
- **allowed_prefixes** – allowed URI prefix(es)

Returns

version object

ska_telmodel.sdp.version.**VERSION_TYPE**

The type of a version parameter.

alias of *Union[int, str]*

ska_telmodel.sdp.version.**check_sdp_interface_version**(version: *str*, allowed_prefixes:
Optional[Union[str, Sequence[str]]] = None)
→ *str*

Check SDP interface version.

Checks that the interface URI has one of the allowed prefixes. If it does, the version number is returned. If not, a ValueError exception is raised.

Parameters

- **version** – SDP interface URI
- **allowed_prefixes** – allowed URI prefix(es)

Returns

version number

ska_telmodel.sdp.version.**normalise_sdp_interface_version**(version: *Union[int, str]*, prefix: *str*) → *str*

Normalise SDP interface version.

Converts deprecated integer version number into a schema URI, where the prefix specifies which schema to use. If the version is a string, it is assumed to be a schema URI and it is returned unchanged.

Parameters

- **version** – SDP interface version
- **prefix** – schema prefix

Returns

SDP interface URI

`ska_telmodel.sdp.version.sdp_interface_versions(prefix: str, min_ver=None, max_ver=None)`

Returns a list of SDP interface version URIs

Parameters

- **prefix** – Interface URI prefix
- **min_ver** – Tuple of minimum version to return
- **max_ver** – Tuple of maximum version to return

1.10 OSD Model

In its simplest form OSD consists of a set of science domain configuration files that are required by the OSO tools. These configuration files hold slowly changing information that is used to configure the science domain behavior of each tool. E.g. tools such as the PPT and ODT can use the information for constructing GUIs and validating setups, the Planning Tool can use it to inform itself of the capabilities available. The idea of OSD is to provide a single source of truth for these data.

Contents

- *OSD Model*
 - *Introduction*
 - *Folder Structure*
 - *General Structure*
 - *API json response template*
 - *API Usage*
 - *Release Steps*

1.10.1 Introduction

Here we have created ‘Observatory Static Data (OSD) Module’.

For creating this framework there are some requirements and architecture have already provided. These are as follows:

- [Observatory Static Data \(OSD\)](#)
- [OSD Documentation Confluence Page](#)

1.10.2 Folder Structure

```
tmdata
├── osd_data
│   ├── observatory_policies.json
│   ├── skal_low
│   │   └── low_capabilities.json
│   ├── skal_mid
│   │   └── mid_capabilities.json
```

- mid_capabilities.json
- low_capabilities.json
- observatory_policies.json

Note: observatory_policies.json is at root, because its common for both Mid and Low.

1.10.3 General Structure

```

├── constant.py
├── helper.py
├── __init__.py
├── osd.py
├── resource
│   └── release.sh
├── version_mapping
│   └── cycle_gitlab_release_version_mapping.json

```

Note: Created a separate JSON file for mapping cycle_id to version number cycle_gitlab_release_version_mapping.json inside version_mapping folder.

Note: Created a bash script release.sh in resource folder.

If user wants to access this framework from CDM, Jupyter Notebook or any other client below is the example. If there is any error then the end user will get the appropriate error message.

This framework can be access by below command:

```

from ska_telmodel.data import TMData
from ska_telmodel.osd.osd import osd_tmdata_source, get_osd_data

source_uris = osd_tmdata_source()
tmdata = TMData(source_uris=source_uris)
osd_data = get_osd_data(tmdata=tmdata)

```

- Location of this framework

| Parameters | Description |
|----------------|--|
| cycle_id | Cycle Id a integer value 1, 2, 3 |
| osd_version | OSD version i.e 1.9.0, 1.12.0 in string format |
| source | From where to get OSD data car or gitlab |
| capabilities | Mid or Low |
| array_assembly | AA0.5, AA1 or any Array Assembly |

ska_telmodel.osd.osd.get_osd_data(capabilities: *Optional[list]* = None, array_assembly: *Optional[str]* = None, tmdata: *Optional[TMData]* = None) → dict[dict[str, Any]]

This function creates OSD class object and returns
osd_data dictionary as json object

Parameters

- **capabilities** – mid or low
- **array_assembly** – in mid there are AA0.5, AA2 and AA1 you can give any one
- **tmdata** – TMDData class object.

Returns

json object

`ska_telmodel.osd.osd.OSD(capabilities: list, array_assembly: str, tmdata: TMDData) → None`

OSD Class for initialing OSD related variables and methods including `get_telescope_observatory_policies`, `get_data` and `get_osd_data`

1.10.4 API json response template

```
{
"observatory_policy": {
  "cycle_number": 1,
"telescope_capabilities": [],
"capabilities": {
  "mid": {},
  "low": {}}
}
```

| Keys | Description |
|------------------------|--|
| observatory_policy | file content of <code>observatory_policies.json</code> file |
| telescope_capabilities | value of <code>telescope_capabilities</code> in file <code>observatory_policies.json</code> |
| capabilities | key value pair of mid and low |
| Mid | file content of <code>mid_capabilities.json</code> with <code>basic_capabilities</code> and <code>Array Assembly AA0.5, AA1</code> etc |
| Low | file content of <code>low_capabilities.json</code> with <code>basic_capabilities</code> and <code>Array Assembly AA0.5, AA1</code> etc |

1.10.5 API Usage

There are two functions -

1. `osd_tmdata_source` function only returns a `source_uris` based on parameters, which is then passed to `TMDData` class which returns `tmdata` object based on source uri.
2. `get_osd_data` function receives this `tmdata` with two other parameters and returns above mentioned json object.

If no parameters are provided to the functions `osd_tmdata_source` and `get_osd_data` then latest version with cycle id is fetched from `cycle_gitlab_release_version_mapping.json` file.

After that `observatory_policies` will be fetched and from there `capabilities` and `array_assembly` is fetched and using API json response template, a json object is returned.

```
from ska_telmodel.data import TMDData
from ska_telmodel.osd.osd import osd_tmdata_source, get_osd_data

source_uris = osd_tmdata_source()
tmdata = TMDData(source_uris=source_uris)
osd_data = get_osd_data(tmdata=tmdata)
```

Calling API with only one parameter `cycle_id` to the function `osd_tmdata_source` and no parameters to the `get_osd_data`. first it will check if the cycle id is valid or not, and will fetch latest version stored in the `cycle_gitlab_release_version_mapping.json` file.

After that observatory_policies will be fetched and from there capabilities and array_assembly is fetched and using API json response template, a json object is returned.

```
from ska_telmodel.data import TMDData
from ska_telmodel.osd.osd import osd_tmdata_source, get_osd_data

source_uris = osd_tmdata_source(cycle_id=1)
tmdata = TMDData(source_uris=source_uris)
osd_data = get_osd_data(tmdata=tmdata)
```

Another way of calling `get_osd_data` function with parameter `capabilities` and no parameters to the `osd_tmdata_source`. latest version and `cycle_id` will be fetched. then `observatory_policies` is fetched and `array_assembly` a json object is returned for latest cycle id, version for capabilities mid.

```
from ska_telmodel.data import TMDData
from ska_telmodel.osd.osd import osd_tmdata_source, get_osd_data

source_uris = osd_tmdata_source()
tmdata = TMDData(source_uris=source_uris)
osd_data = get_osd_data(capabilities=['mid'], tmdata=tmdata)
```

Calling `osd_tmdata_source` with parameter `cycle_id` and `get_osd_data` with `capabilities` and `array_assembly`. cycle id is checked valid or not then `observatory_policies` is fetched, then `capabilities` and `array_assembly` is returned in json object.

```
from ska_telmodel.data import TMDData
from ska_telmodel.osd.osd import osd_tmdata_source, get_osd_data

source_uris = osd_tmdata_source(cycle_id=1)
tmdata = TMDData(source_uris=source_uris)
osd_data = get_osd_data(capabilities=['mid'], array_assembly="AA0.5", tmdata=tmdata)
```

Note: If source is not provided in the `get_osd_data` function call, the default is set to `car`. API will fetch data from Car Gitlab repo. other option is `file`. if `gitlab_branch` parameter is provided to the `osd_tmdata_source` source is set to the gitlab.

Warning: If `cycle_id` value is not valid following exception will be raised.

```
OSDDDataException: Cycle id {cycle_id value here} is not valid, Available IDs are {list
↳ of cycle_ids present in the json file}
```

If capabilities value is not valid following exception will be raised.

```
OSDDDataException: Capability {capability value here} doesn't exists, Available are low,
→ mid, observatory_policies
```

If array_assembly value is not valid following exception will be raised.

```
OSDDDataException: Keyerror {array_assembly value here} doesn't exists
```

1.10.6 Release Steps

1. Create a JIRA issue and the branch

1st: Create a new issue on the Release Management Jira Project with a summary of your release, and set it to “IN PROGRESS”.

2nd: Create and checkout a new rel-XXX-release-v-1-2-2 branch (where REL-XXX is your Jira issue.)

2. Check the Current Version

```
make show-version
```

3. Bump the Version

```
make bump-patch-release
```

4. Run below command for OSD release

Created a target called `osd-pre-release` in Makefile which will run when `ska_telmodel` is released. also added a `release.sh` file inside `osd resources` folder which has two functions `GetCycleId` and `UpdateAndAddValue`

`GetCycleId` function gets `cycle_number` from `observatory_policies.json` file and triggers next function `UpdateAndAddValue` which updates or add `cycle_id` values in version mapping json file.

```
make osd-pre-release
```

5. Set the Release

- [For remaining release steps click here](#)

Warning: This is a very crucial part for OSD, without this some functionality may break and exceptions and errors will be raised.

1.11 Central Signal Processor schemas

Schemas used for commands for Mid and Low CSP LMC.

Some of these schemas are also used by Mid.CBF. See *Mid CBF schemas* for details.

1.11.1 Central Signal Processor schemas

Schemas used for commands for Mid CSP LMC.

ska-csp-assignresources

CSP assignresources 2.2

Example JSON

```
{
  "interface": "https://schema.skao.int/ska-csp-assignresources/2.2",
  "subarray_id": 1,
  "dish": {
    "receptor_ids": ["SKA001", "SKA036"]
  }
}
```

| | | | | |
|---|---|--|---------|--|
| https://schema.skao.int/ska-csp-assignresources/2.2 | | | | |
| type | object | | | |
| properties | | | | |
| • interface | URI of JSON schema applicable to this JSON payload. | | | |
| | type | string | | |
| • subarray_id | The Subarray ID that the list of receptors will be assigned to. For Mid, there are a maximum of 16 subarrays. | | | |
| | type | integer | | |
| • dish | type | object | | |
| | properties | | | |
| | • receptor_ids | The list of receptors that will be assigned to the Subarray ID. Receptor IDs can be any string, not necessarily numbers. Valid receptor IDs include: SKA dishes: “SKAnnn”, where nnn is a zero padded integer in the range of 001 to 133. MeerKAT dishes: “MKTnnn”, where nnn is a zero padded integer in the range of 000 to 063. | | |
| | | type | array | |
| | | items | type | string |
| | | | pattern | ^(SKA(00[1-9][0-9][0-9])1[0-2][0-9] 13[0-3])) (MKT(0[0-5][0-9] 06[0-3]))\$ |
| | additionalProperties | False | | |
| additionalProperties | False | | | |

ska-csp-configure

CSP config 2.5

Example (TMC input for science_a visibility scan)

```
{
  "interface": "https://schema.skao.int/ska-csp-configure/2.0",
  "subarray": {
    "subarray_name": "science period 23"
  },
  "common": {
    "config_id": "sbi-mvp01-20200325-00001-science_A",
    "frequency_band": "1",
    "subarray_id": 1
  },
  "cbf": {
    "fsp": [{
      "fsp_id": 1,
      "function_mode": "CORR",
      "frequency_slice_id": 1,
      "integration_factor": 1,
      "zoom_factor": 0,
      "channel_averaging_map": [
        [0, 2],
        [744, 0]
      ],
      "channel_offset": 0,
      "output_link_map": [
        [0, 0],
        [200, 1]
      ]
    }, {
      "fsp_id": 2,
      "function_mode": "CORR",
      "frequency_slice_id": 2,
      "integration_factor": 1,
      "zoom_factor": 1,
      "zoom_window_tuning": 650000,
      "channel_averaging_map": [
        [0, 2],
        [744, 0]
      ],
      "channel_offset": 744,
      "output_link_map": [
        [0, 4],
        [200, 5]
      ]
    }
  ],
  "vlbi": {}
},
  "pst": {}
}
```

Example (CSP configuration for science_a visibility scan)

```
{
  "interface": "https://schema.skao.int/ska-csp-configure/2.0",
  "subarray": {
    "subarray_name": "science period 23"
  },
  "common": {
    "config_id": "sbi-mvp01-20200325-00001-science_A",
    "frequency_band": "1",
    "subarray_id": 1
  },
  "cbf": {
    "fsp": [{
      "fsp_id": 1,
      "function_mode": "CORR",
      "frequency_slice_id": 1,
      "integration_factor": 1,
      "zoom_factor": 0,
      "channel_averaging_map": [
        [0, 2],
        [744, 0]
      ],
      "channel_offset": 0,
      "output_link_map": [
        [0, 0],
        [200, 1]
      ],
      "output_host": [
        [0, "192.168.0.1"],
        [400, "192.168.0.2"]
      ],
      "output_mac": [
        [0, "06-00-00-00-00-00"]
      ],
      "output_port": [
        [0, 9000, 1],
        [400, 9000, 1]
      ]
    }], {
      "fsp_id": 2,
      "function_mode": "CORR",
      "frequency_slice_id": 2,
      "integration_factor": 1,
      "zoom_factor": 1,
      "zoom_window_tuning": 650000,
      "channel_averaging_map": [
        [0, 2],
        [744, 0]
      ],
      "channel_offset": 744,
      "output_link_map": [
        [0, 4],
```

| additionalProperties | False | |

Common configuration schema 2.5

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | | |
|----------------------|--|--------------------------------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • config_id | type | <i>string</i> | |
| | default | null | |
| • subarray_id | Subarray number | | |
| | type | <i>integer</i> | |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | | |
| | type | <i>string</i> | |
| | pattern | ^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| | default | null | |
| | | | |
| • band_5_tuning | Center frequency for the Band-of-Interest. Required if Band is 5a or 5b; not specified for other Bands (not configurable for Band 1, 2, 3 and 4). Input for Band 5a and 5b consists of two 2.5 GHz streams; the center frequency can be independently tuned for each stream. The following nomenclature is used to refer to Band 5a and 5b streams: 5a1, 5a2, 5b1, 5b2. | | |
| | type | <i>array</i> | |
| | default | null | |
| | items | type | <i>number</i> |
| | | | |
| • frequency_band | Frequency band applies for all the receptors (VCCs) that belong to the sub-array. The value of 'low' is used to only within SKA Low. As this field is a mandatory field but bands 1, 2, 3, 4, 5a and 5b only make sense for SKA Mid. | | |
| | type | <i>string</i> | |
| | pattern | ^(1 2 3 4 5(a b))low)\$ | |
| additionalProperties | False | | |

CBF config 2.5

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-element. This section is forwarded only to CBF subelement. Most of it to be borrowed from IICD

| type | <i>object</i> | | |
|---|---|---|------|
| properties | | | |
| <ul style="list-style-type: none">frequency_band_offset_stream1 | Optionally, an offset can be specified so that the entire observed band is shifted (to accommodate a Zoom Window that crosses a ‘natural’ Frequency Slice boundary). If specified, applies for all the receptors in the sub-array. Bands 1, 2, 3 and 4: input from the receptor consists of a single data stream; the Frequency Band Offset (FBO) should be specified for Stream 1 only. Bands 5a and 5b: input from the receptor consists of two data streams; the FBO can be specified for each stream independently. Note: For Band 5a and 5b the frequency shift is performed by the receptor (DISH). Note: This is optional and does not need to be implemented in PI3, but would be great for demo; if Team Buttons is looking for opportunities to showcase interesting GUIs, Zoom Windows are perfect opportunity (would require TMC and CSP to support these two parameters, corrBandwidth values > 0 and zoom window tuning.) | | |
| | type | <i>integer</i> | |
| | default | null | |
| | | | |

FSP config 2.5

| | | | | |
|--------------------------------|--|--|--|--|
| type | <i>object</i> | | | |
| properties | | | | |
| • fsp_id | type | <i>integer</i> | | |
| • func- tion_mode | allOf | type | <i>string</i> | |
| | | enum | CORR, PSS-BF, PST-BF, VLBI | |
| • receptors | Optionally a subset of receptors to be correlated can be specified. If not specified, all receptors that belong to the subarray are cross-correlated (i.e. visibilities for all the baselines in the subarray are generated and transmitted to SDP). Valid receptor IDs include: SKA dishes: “SKAnnn”, where nnn is a zero padded integer in the range of 001 to 133. MeerKAT dishes: “MKTnnn”, where nnn is a zero padded integer in the range of 000 to 063. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | type | <i>string</i> | |
| | | pattern | ^(SKA(00[1-9][0[1-9]][0-9][1[0-2]][0-9][13[0-3]])) (MKT(0[0-5][0-9][06[0-3]]))\$ | |
| • fre- quency_slice | Frequency Slice to be processed on this FSP (valid range depends on the Frequency Band). | | | |
| • zoom_factor | type | <i>integer</i> | | |
| | Bandwidth to be correlated calculated as FSBW/2n, where n is in range [0..6]. When n=0 the full Frequency Slice bandwidth is correlated. BW > 0 implies ‘Zoom Window’ configuration; the spectral Zoom Window tuning must be specified. | | | |
| | type | <i>integer</i> | | |
| • zoom_window | The Zoom Window tuning provided in absolute terms as RF center frequency. Based on that, CSB_Mid calculates tuning within the data stream received from the receptor. Must be selected so that the entire Zoom Window is within the Frequency Slice. If partially out of the FS a warning is generated. If completely outside of the FS an exception is generated. Step size <= 0.01MHz. The Frequency Band Offset can be used to shift the entire observed band in order to accommodate a Zoom Window that spans across a Frequency Slice boundary. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| | • integra- tion_factor | Integration time for the correlation products, defines multiple of 140 milliseconds. | | |
| | type | <i>integer</i> | | |

VLBI config 2.5

Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| additionalProperties | False | |

Search window config 2.5

Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.

| | | | | |
|------------------------------------|--|----------------|------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • search_window_id | Identifier of the 300MHz Search Window. Unique within a sub-array. | | | |
| | type | <i>integer</i> | | |
| • search_window_tuning | The Search Window tuning is provided in absolute terms as RF center frequency. The Search Window must be placed within the observed band. If partially out of the observed Band a warning is generated. If completely outside of the observed Band an exception is generated. | | | |
| | type | <i>integer</i> | | |
| • tdc_enable | Enable / disable Transient Data Capture for the Search Window. | | | |
| | type | <i>boolean</i> | | |
| • tdc_num_bits | Number of bits per sample (for the Transient Data Capture). Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_before_epoch | Users can trade the period of time for which data are saved and transmitted for the sample bit-width and/or the number of Search Windows. The exact information regarding the memory capacity per receptor and supported range will be provided in construction. The epoch is specified in the command that triggers TDC off-loading (transmission of data). | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_after_epoch | see <i>tdcPeriodBeforeEpoch</i> | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_destination_addresses | Destination addresses (MAC, IP, port) for off-loading of the content of the Transient Data Capture Buffer, specified per receptor. The destination addresses for the content of the Transient Data Capture can be provided either as a part of the scan configuration or by the command that triggers transmission of the captured data. The latter, if provided, overrides previously set addresses. Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | anyOf | type | <i>integer</i> |
| | | | type | <i>string</i> |

| | | |
|-------------------------------------|---|----------------|
| • integration_time | Scan duration. | |
| | type | <i>integer</i> |
| • acc_range | Range in source acceleration to be searched. | |
| | type | <i>integer</i> |
| | default | null |
| • number_of_trials | Number of trials to be performed. | |
| | type | <i>integer</i> |
| • time_resolution | Time resolution of input data. | |
| | type | <i>integer</i> |
| • ps_dm | Dispersion correction for acceleration search. | |
| | type | <i>number</i> |
| • sps_dm | Dispersion correction for transient search. | |
| | type | <i>number</i> |
| • timesam- ple_per_block | Number of time samples in each block of data. | |
| | type | <i>integer</i> |
| • sub_bands | Number of frequency band groups summed up during folding. | |
| | type | <i>integer</i> |
| • buffer_size | Size of the buffer receiving raw data. (2**buffer_size) | |
| | type | <i>integer</i> |
| • hsum_control | Number of the “harmonic folds” on the initial Fourier power-spectrum summed up. | |
| | type | <i>integer</i> |
| • cxft_control | CXFT control parameters. | |
| | type | <i>object</i> |
| • cand_sift | Constraints on matches between candidates. | |
| | type | <i>object</i> |
| • cand_output | Define data sinks and subscriber to be notified. | |
| | type | <i>object</i> |
| • sp_threshold | Threshold for a single pulse trigger. (Tuned to system noise and RFI env.) | |
| | type | <i>number</i> |
| • sp_opt_pars | Single pulse optimization parameters. | |
| | type | <i>object</i> |
| • dred_beam_stats | DRED: statistics of spectra to derive the normalization factors. | |
| | type | <i>object</i> |
| • cdos_control | CDOS: control parameters and related statistical data. | |
| | type | <i>object</i> |
| • rfim_control | RFIM control parameters. | |
| | type | <i>object</i> |
| • fldo_control | FLDO control parameters. | |

PSS beam config 2.5

| | | | |
|----------------------|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • beam_id | Search Beam ID. | | |
| | type | <i>integer</i> | |
| • ra | Right Ascension of sub-array beam target, in degrees. | | |
| | type | <i>number</i> | |
| | default | null | |
| • dec | Declination of sub-array beam target, in degrees. | | |
| | type | <i>number</i> | |
| | default | null | |
| • reference_frame | reference frame for pointing coordinates | | |
| | default | null | |
| | allOf | type | <i>string</i> |
| | | enum | ICRS, HORIZON |
| • centre_frequency | Centre frequency of the search beam. | | |
| | type | <i>number</i> | |
| • beam_delay_centre | Beam delay center, relative to the array delay center. | | |
| | anyOf | type | <i>number</i> |
| | | type | <i>string</i> |
| • dest_host | Per beam destination host address for PSS output. | | |
| | type | <i>string</i> | |
| | default | null | |
| • dest_port | Per beam destination port for PSS output. | | |
| | type | <i>integer</i> | |
| | default | null | |
| additionalProperties | False | | |

PST scan configuration 2.5

Pulsar Timing specific scan configuration parameters.

| | | |
|--------------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| | default | null |

Table 3 – continued from previous page

| | | |
|---------------------------------|---|---|
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |

continues on next page

Table 3 – continued from previous page

| | | | |
|------------------------------|---|--------|-------------------|
| • source | The name of the source. Keyword: SRC_NAME | | |
| | type | string | |
| • itrfrf | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | | |
| | type | array | |
| | items | type | number |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | | |
| | type | string | |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | | |
| | allOf | type | string |
| | | enum | LIN, CIRC |
| • feed_handedness | Code for sense of feed. For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky). For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA). For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe. Range: -1 or +1 Keyword: FD_HAND | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| • feed_angle | Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver). Units: degrees Range: -180 to 180. Keyword: FD_SANG | | |
| | type | number | |
| • feed_tracking_mode | The tracking mode for the feed: mode FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. <ul style="list-style-type: none">• CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north.• SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation.• TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. Range: FA, CPA, SPA, or TPA Keyword: FD_MODE | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| • feed_position_angle | The requested angle of feed reference. If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'. Range: -180 to +180. Keyword: FA_REQ | | |
| | type | number | |

Table 3 – continued from previous page

| | | | | | |
|---------------------------------|--|---------|---------|---------|--|
| • oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Range: 8/7 or 4/3 Keyword: OVERSAMP | | | | |
| | type | array | | | |
| | items | type | integer | | |
| • coordinates | The tied-array beam's tracking co-ordinates. As of version 2.2 of the schema this only handles equitorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future. <i>PST RA_Dec coordinates 2.5</i> | | | | |
| • max_scan_length | The maximum length of the observation. Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX | | | | |
| • subint_duration | type | number | | | |
| | The length of each output sub-integration. Units: seconds Range: 1 - 60 Keyword: OUTSUBINT | | | | |
| • receptors | type | number | | | |
| | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | | |
| | type | array | | | |
| • receptor_weights | items | type | string | | |
| | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | | |
| | type | array | | | |
| • num_rfi_frequency_mask | items | type | number | | |
| | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | | |
| | type | integer | | | |
| • rfi_frequency_masks | default | 0 | | | |
| | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | | |
| | type | array | | | |
| | default | null | | | |
| | items | type | array | | |
| | | items | type | number | |
| | | | | | |
| • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | | | |
| | type | array | | | |
| | default | null | | | |
| | items | anyOf | type | string | |
| | | | type | integer | |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | | |
| | type | string | | | |
| | default | null | | | |
| • pt | Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration. | | | | |
| | default | null | | | |

continues on next page

Table 3 – continued from previous page

| | | |
|-----------------------------|---|---|

| | <i>PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.5</i> | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | |
| | default | null |
| | <i>PST ‘FLOW_THROUGH’ mode configuration 2.5</i> | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in FSP and 1 in PST BF. | |
| | Keyword: NSTAGE | |
| | type | integer |
| • channelization_stages | List of configuration for each channelization stage. | |
| | type | array |
| | items | Pulsar Timing specific parameters for channelization stage configuration. |
| | <i>PST channelization stage configuration 2.5</i> | |
| additionalProperties | False | |

PST RA_Dec coordinates 2.5

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is ‘hh:mm:ss.sss’ or ‘ddd.ddd’ Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is ‘hh:mm:ss.sss’ or ‘ddd.ddd’ Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.5

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode. PST spectral kurtosis configuration 2.5 |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.5

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode.

| | | | |
|-------------------------------|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| • sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| • sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.5

Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration.

| | | | |
|------------------------------------|--|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 4 – continued from previous page

| | | |
|--------------------------------------|---|---|
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. PST spectral kurtosis configuration 2.5 |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.5

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|---|---|---------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisa- tion_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | | | |
| • polarizations | The polarizations to be recorded. Valid values: A, B, or Both Keyword: POLN_FT | | |
| | allOf | type | <i>string</i> |
| | | enum | A, B, Both |
| • requantisa- tion_init_time | Time interval spanned by data used at the start of a scan to determine the scale factors applied before re-quantisation. Units: seconds Keyword: DIGITIZER_INIT_TIME | | |
| | type | <i>number</i> | |
| | | | |
| additionalProperties | False | | |

PST channelization stage configuration 2.5

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---------------------------------|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| • filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| • num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| • oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.5

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |
|----------------------|---------------|
| type | <i>object</i> |
| properties | |
| additionalProperties | False |

CSP config 2.4

| additionalProperties | False | |

Common configuration schema 2.4

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$</code> |
| | default | null |
| • band_5_tuning | Center frequency for the Band-of-Interest. Required if Band is 5a or 5b; not specified for other Bands (not configurable for Band 1, 2, 3 and 4). Input for Band 5a and 5b consists of two 2.5 GHz streams; the center frequency can be independently tuned for each stream. The following nomenclature is used to refer to Band 5a and 5b streams: 5a1, 5a2, 5b1, 5b2. | |
| | type | <i>array</i> |
| | default | null |
| | items | type <i>number</i> |
| • frequency_band | Frequency band applies for all the receptors (VCCs) that belong to the sub-array. The value of 'low' is used to only within SKA Low. As this field is a mandatory field but bands 1, 2, 3, 4, 5a and 5b only make sense for SKA Mid. | |
| | type | <i>string</i> |
| | pattern | <code>^(1 2 3 4 5(a b) low)\$</code> |
| additionalProperties | False | |

CBF config 2.4

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF subelement. This section is forwarded only to CBF subelement. Most of it to be borrowed from IICD

| type | <i>object</i> | |
|---|---|---|
| properties | | |
| • frequency_band_offset_stream1 | Optionally, an offset can be specified so that the entire observed band is shifted (to accommodate a Zoom Window that crosses a ‘natural’ Frequency Slice boundary). If specified, applies for all the receptors in the sub-array. Bands 1, 2, 3 and 4: input from the receptor consists of a single data stream; the Frequency Band Offset (FBO) should be specified for Stream 1 only. Bands 5a and 5b: input from the receptor consists of two data streams; the FBO can be specified for each stream independently. Note: For Band 5a and 5b the frequency shift is performed by the receptor (DISH). Note: This is optional and does not need to be implemented in PI3, but would be great for demo; if Team Buttons is looking for opportunities to showcase interesting GUIs, Zoom Windows are perfect opportunity (would require TMC and CSP to support these two parameters, corrBandwidth values > 0 and zoom window tuning.) | |
| | type | <i>integer</i> |
| | default | null |
| • frequency_band_offset_stream2 | See <i>frequencyBandOffsetStream1</i> | |
| | type | <i>integer</i> |
| | default | null |
| • delay_model_subscription_point | FQDN of TMC.DelayModel TANGO attribute which exposes delay values for all the dishes assigned to a Subarray in JSON format. Delay values are updated every 10 seconds. | |
| | type | <i>string</i> |
| | default | null |
| • doppler_phase_corr_subscription_point | The same model applies for all receptors that belong to the subarray. Defined by TMC using publish-subscribe mechanism (see ICD Section 3.8.8.5.3). The Doppler phase correction, by default, applies only to the CSP_Mid Processing Mode Correlation; optionally may apply to other Processing Modes as well. | |
| | type | <i>string</i> |
| | default | null |
| • rfi_flagging_mask | Specified as needed in advance of the scan start and/or during the scan. Delivered using publish-subscribe mechanism (see ICD Section 3.8.8.5.7). | |
| | type | <i>object</i> |
| | default | null |
| | properties | |
| | additionalProperties | True |
| • fsp | type | <i>array</i> |
| | items | <i>FSP config 2.4</i> |
| • vlbi | Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement. | |
| | default | null |
| | <i>VLBI config 2.4</i> | |
| • search_window | type | <i>array</i> |
| | default | null |
| | items | Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming. |
| | <i>Search window config 2.4</i> | |
| additionalProperties | False | |

FSP config 2.4

VLBI config 2.4

Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| additionalProperties | False | |

Search window config 2.4

Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.

| | | | | |
|------------------------------------|--|----------------|------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • search_window_id | Identifier of the 300MHz Search Window. Unique within a sub-array. | | | |
| | type | <i>integer</i> | | |
| • search_window_tuning | The Search Window tuning is provided in absolute terms as RF center frequency. The Search Window must be placed within the observed band. If partially out of the observed Band a warning is generated. If completely outside of the observed Band an exception is generated. | | | |
| | type | <i>integer</i> | | |
| • tdc_enable | Enable / disable Transient Data Capture for the Search Window. | | | |
| | type | <i>boolean</i> | | |
| • tdc_num_bits | Number of bits per sample (for the Transient Data Capture). Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_before_epoch | Users can trade the period of time for which data are saved and transmitted for the sample bit-width and/or the number of Search Windows. The exact information regarding the memory capacity per receptor and supported range will be provided in construction. The epoch is specified in the command that triggers TDC off-loading (transmission of data). | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_after_epoch | see <i>tdcPeriodBeforeEpoch</i> | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_destination_addresses | Destination addresses (MAC, IP, port) for off-loading of the content of the Transient Data Capture Buffer, specified per receptor. The destination addresses for the content of the Transient Data Capture can be provided either as a part of the scan configuration or by the command that triggers transmission of the captured data. The latter, if provided, overrides previously set addresses. Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | anyOf | type | <i>integer</i> |
| | | | type | <i>string</i> |
| additionalProperties | False | | | |

PSS configuration 2.4

| | | |
|-------------------------------|--|----------------|
| type | <i>object</i> | |
| properties | | |
| • beam_bandwidth | Beam bandwidth (MHz) | |
| | type | <i>integer</i> |
| • chan-nels_per_beam | Number of channels per beam | |
| | type | <i>integer</i> |
| • accelera-tion_search | Processing Mode: Acceleration Search (a.k.a. Pulsar Search) and Single Pulse Search (a.k.a. Transient Search) can be performed concurrently. | |
| | type | <i>boolean</i> |
| • sin-gle_pulse_search | Processing Mode: Acceleration Search (a.k.a. Pulsar Search) and Single Pulse Search (a.k.a. Transient Search) can be performed concurrently. | |
| | type | <i>boolean</i> |

Table 6 – continued from previous page

| | | |
|-------------------------------------|---|----------------|
| • integration_time | Scan duration. | |
| | type | <i>integer</i> |
| • acc_range | Range in source acceleration to be searched. | |
| | type | <i>integer</i> |
| | default | null |
| • number_of_trials | Number of trials to be performed. | |
| | type | <i>integer</i> |
| • time_resolution | Time resolution of input data. | |
| | type | <i>integer</i> |
| • ps_dm | Dispersion correction for acceleration search. | |
| | type | <i>number</i> |
| • sps_dm | Dispersion correction for transient search. | |
| | type | <i>number</i> |
| • timesam- ple_per_block | Number of time samples in each block of data. | |
| | type | <i>integer</i> |
| • sub_bands | Number of frequency band groups summed up during folding. | |
| | type | <i>integer</i> |
| • buffer_size | Size of the buffer receiving raw data. (2**buffer_size) | |
| | type | <i>integer</i> |
| • hsum_control | Number of the “harmonic folds” on the initial Fourier power-spectrum summed up. | |
| | type | <i>integer</i> |
| • cxft_control | CXFT control parameters. | |
| | type | <i>object</i> |
| • cand_sift | Constraints on matches between candidates. | |
| | type | <i>object</i> |
| • cand_output | Define data sinks and subscriber to be notified. | |
| | type | <i>object</i> |
| • sp_threshold | Threshold for a single pulse trigger. (Tuned to system noise and RFI env.) | |
| | type | <i>number</i> |
| • sp_opt_pars | Single pulse optimization parameters. | |
| | type | <i>object</i> |
| • dred_beam_stats | DRED: statistics of spectra to derive the normalization factors. | |
| | type | <i>object</i> |
| • cdos_control | CDOS: control parameters and related statistical data. | |
| | type | <i>object</i> |
| • rfim_control | RFIM control parameters. | |
| | type | <i>object</i> |
| • fldo_control | FLDO control parameters. | |
| | type | <i>object</i> |
| | properties | |
| | • phase_split | <i>boolean</i> |
| | • channel_scale | <i>boolean</i> |
| | • max_phases | <i>integer</i> |
| | additionalProperties | True |
| • beam | type | <i>array</i> |

| | items | <i>PSS beam config 2.4</i> |
| additionalProperties | False | |

PSS beam config 2.4

| | | | |
|----------------------|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • beam_id | Search Beam ID. | | |
| | type | <i>integer</i> | |
| • ra | Right Ascension of sub-array beam target, in degrees. | | |
| | type | <i>number</i> | |
| | default | null | |
| • dec | Declination of sub-array beam target, in degrees. | | |
| | type | <i>number</i> | |
| | default | null | |
| • reference_frame | reference frame for pointing coordinates | | |
| | default | null | |
| | allOf | type | <i>string</i> |
| | | enum | ICRS, HORIZON |
| • centre_frequency | Centre frequency of the search beam. | | |
| | type | <i>number</i> | |
| • beam_delay_centre | Beam delay center, relative to the array delay center. | | |
| | anyOf | type | <i>number</i> |
| | | type | <i>string</i> |
| • dest_host | Per beam destination host address for PSS output. | | |
| | type | <i>string</i> | |
| | default | null | |
| • dest_port | Per beam destination port for PSS output. | | |
| | type | <i>integer</i> | |
| | default | null | |
| additionalProperties | False | | |

PST scan configuration 2.4

Pulsar Timing specific scan configuration parameters.

| | | |
|--------------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| | default | null |

Table 7 – continued from previous page

| | | |
|---------------------------------|---|---|
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |

continues on next page

Table 7 – continued from previous page

| | | | |
|------------------------------|---|--------|-------------------|
| • source | The name of the source. Keyword: SRC_NAME | | |
| | type | string | |
| • itrfrf | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | | |
| | type | array | |
| | items | type | number |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | | |
| | type | string | |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | | |
| | allOf | type | string |
| | | enum | LIN, CIRC |
| • feed_handedness | Code for sense of feed. For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky). For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA). For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe. Range: -1 or +1 Keyword: FD_HAND | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| • feed_angle | Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver). Units: degrees Range: -180 to 180. Keyword: FD_SANG | | |
| | type | number | |
| • feed_tracking_mode | The tracking mode for the feed: mode FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. <ul style="list-style-type: none">• CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north.• SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation.• TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. Range: FA, CPA, SPA, or TPA Keyword: FD_MODE | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| • feed_position_angle | The requested angle of feed reference. If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'. Range: -180 to +180. Keyword: FA_REQ | | |
| | type | number | |

continues on next page

Table 7 – continued from previous page

| | | | |
|---------------------------------|--|---------|---------------------------|
| • oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Range: 8/7 or 4/3 Keyword: OVERSAMP | | |
| | type | array | |
| | items | type | integer |
| • coordinates | The tied-array beam's tracking co-ordinates. As of version 2.2 of the schema this only handles equitorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future. <i>PST RA_Dec coordinates 2.4</i> | | |
| • max_scan_length | The maximum length of the observation. Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX | | |
| | type | number | |
| • subint_duration | The length of each output sub-integration. Units: seconds Range: 1 - 60 Keyword: OUTSUBINT | | |
| | type | number | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | |
| | type | array | |
| | items | type | string |
| • receptor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | |
| | type | array | |
| | items | type | number |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | |
| | type | integer | |
| | default | 0 | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | |
| | type | array | |
| | default | null | |
| | items | type | array |
| | | items | type number |
| • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | |
| | type | array | |
| | default | null | |
| | items | anyOf | type string integer |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | |
| | type | string | |
| | default | null | |
| • pt | Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration. | | |
| | default | null | |

continues on next page

Table 7 – continued from previous page

| | | |
|-----------------------------|---|---|
| | <i>PST ‘PULSAR_TIMING’ mode configuration 2.4</i> | |
| • ds | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | |
| | default | null |
| | <i>PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.4</i> | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | |
| | default | null |
| | <i>PST ‘FLOW_THROUGH’ mode configuration 2.4</i> | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in FSP and 1 in PST BF. | |
| | Keyword: NSTAGE | |
| | type | integer |
| • channelization_stages | List of configuration for each channelization stage. | |
| | type | array |
| | items | Pulsar Timing specific parameters for channelization stage configuration. |
| | <i>PST channelization stage configuration 2.4</i> | |
| additionalProperties | False | |

PST RA_Dec coordinates 2.4

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is ‘hh:mm:ss.sss’ or ‘ddd.ddd’ Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is ‘hh:mm:ss.sss’ or ‘ddd.ddd’ Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST ‘PULSAR_TIMING’ mode configuration 2.4

Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration.

| | | |
|------------------------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. PST spectral kurtosis configuration 2.4 |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.4

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode.

| | | | |
|-------------------------------|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| • sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| • sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.4

Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration.

| | | | |
|------------------------------------|--|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 8 – continued from previous page

| | | |
|--------------------------------------|---|---|
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. PST spectral kurtosis configuration 2.4 |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.4

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|--------------------------------|---|--|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisation_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • num_channels | The number of input channels to be recorded. This value must be less than or equal to the output_frequency_channels. Keyword: NCHAN_FT | |
| type | | <i>integer</i> | |
| • requantisation_length | | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> | |
| | additionalProperties | False | |

PST channelization stage configuration 2.4

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---------------------------------|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| • filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| • num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| • oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.4

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |
|----------------------|---------------|
| type | <i>object</i> |
| properties | |
| additionalProperties | False |

Common configuration schema 2.3

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$</code> |
| | default | null |
| • band_5_tuning | Center frequency for the Band-of-Interest. Required if Band is 5a or 5b; not specified for other Bands (not configurable for Band 1, 2, 3 and 4). Input for Band 5a and 5b consists of two 2.5 GHz streams; the center frequency can be independently tuned for each stream. The following nomenclature is used to refer to Band 5a and 5b streams: 5a1, 5a2, 5b1, 5b2. | |
| | type | <i>array</i> |
| | default | null |
| | items | type <i>number</i> |
| • frequency_band | Frequency band applies for all the receptors (VCCs) that belong to the sub-array. | |
| | type | <i>string</i> |
| | pattern | <code>^(1 2 3 4 5(a b))\$</code> |
| additionalProperties | False | |

CBF config 2.3

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-element. This section is forwarded only to CBF subelement. Most of it to be borrowed from IICD

| type | <i>object</i> | |
|---|---|--|
| properties | | |
| <ul style="list-style-type: none">frequency_band_offset_stream1 | <p>Optionally, an offset can be specified so that the entire observed band is shifted (to accommodate a Zoom Window that crosses a ‘natural’ Frequency Slice boundary). If specified, applies for all the receptors in the sub-array. Bands 1, 2, 3 and 4: input from the receptor consists of a single data stream; the Frequency Band Offset (FBO) should be specified for Stream 1 only. Bands 5a and 5b: input from the receptor consists of two data streams; the FBO can be specified for each stream independently. Note: For Band 5a and 5b the frequency shift is performed by the receptor (DISH). Note: This is optional and does not need to be implemented in PI3, but would be great for demo; if Team Buttons is looking for opportunities to showcase interesting GUIs, Zoom Windows are perfect opportunity (would require TMC and CSP to support these two parameters, corrBandwidth values > 0 and zoom window tuning.)</p> | |
| | type | <i>integer</i> |
| | default | null |
| <ul style="list-style-type: none">frequency_band_offset_stream2 | <i>See frequencyBandOffsetStream1</i> | |
| | type | <i>integer</i> |
| | default | null |
| <ul style="list-style-type: none">delay_model_subscription_point | FQDN of TMC.DelayModel TANGO attribute which exposes delay values for all the dishes assigned to a Subarray in JSON format. Delay values are updated every 10 seconds. | |
| | type | <i>string</i> |
| | default | null |
| <ul style="list-style-type: none">doppler_phase_corr_subscription_point | <p>The same model applies for all receptors that belong to the subarray. Defined by TMC using publish-subscribe mechanism (see ICD Section 3.8.8.5.3). The Doppler phase correction, by default, applies only to the CSP_Mid Processing Mode Correlation; optionally may apply to other Processing Modes as well.</p> | |
| | type | <i>string</i> |
| | default | null |
| <ul style="list-style-type: none">rfi_flagging_mask | <p>Specified as needed in advance of the scan start and/or during the scan. Delivered using publish-subscribe mechanism (see ICD Section 3.8.8.5.7).</p> | |
| | type | <i>object</i> |
| | default | null |
| | properties | |
| | additionalProperties | True |
| <ul style="list-style-type: none">fsp | type | <i>array</i> |
| | items | <i>FSP config 2.3</i> |
| <ul style="list-style-type: none">vlbi | <p>Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.</p> | |
| | default | null |
| | <i>VLBI config 2.3</i> | |
| <ul style="list-style-type: none">search_window | type | <i>array</i> |
| | default | null |
| | items | <p>Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.</p> |
| | | <i>Search window config 2.3</i> |
| additionalProperties | False | |

FSP config 2.3

| | | | | |
|--------------------------------|--|--|--|--|
| type | <i>object</i> | | | |
| properties | | | | |
| • fsp_id | type | <i>integer</i> | | |
| • func- tion_mode | allOf | type | <i>string</i> | |
| | | enum | CORR, PSS-BF, PST-BF, VLBI | |
| • receptors | Optionally a subset of receptors to be correlated can be specified. If not specified, all receptors that belong to the subarray are cross-correlated (i.e. visibilities for all the baselines in the subarray are generated and transmitted to SDP). Valid receptor IDs include: SKA dishes: “SKAnnn”, where nnn is a zero padded integer in the range of 001 to 133. MeerKAT dishes: “MKTnnn”, where nnn is a zero padded integer in the range of 000 to 063. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | type | <i>string</i> | |
| | | pattern | ^(SKA(00[1-9][0[1-9]][0-9][1[0-2]][0-9][13[0-3]])) (MKT(0[0-5][0-9][06[0-3]]))\$ | |
| • fre- quency_slice | Frequency Slice to be processed on this FSP (valid range depends on the Frequency Band). | | | |
| • zoom_factor | type | <i>integer</i> | | |
| | Bandwidth to be correlated calculated as FSBW/2n, where n is in range [0..6]. When n=0 the full Frequency Slice bandwidth is correlated. BW > 0 implies ‘Zoom Window’ configuration; the spectral Zoom Window tuning must be specified. | | | |
| | type | <i>integer</i> | | |
| • zoom_window | The Zoom Window tuning provided in absolute terms as RF center frequency. Based on that, CSB_Mid calculates tuning within the data stream received from the receptor. Must be selected so that the entire Zoom Window is within the Frequency Slice. If partially out of the FS a warning is generated. If completely outside of the FS an exception is generated. Step size <= 0.01MHz. The Frequency Band Offset can be used to shift the entire observed band in order to accommodate a Zoom Window that spans across a Frequency Slice boundary. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| | • integra- tion_factor | Integration time for the correlation products, defines multiple of 140 milliseconds. | | |
| | type | <i>integer</i> | | |

VLBI config 2.3

Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| additionalProperties | False | |

Search window config 2.3

Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.

| | | | | |
|------------------------------------|--|----------------|------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • search_window_id | Identifier of the 300MHz Search Window. Unique within a sub-array. | | | |
| | type | <i>integer</i> | | |
| • search_window_tuning | The Search Window tuning is provided in absolute terms as RF center frequency. The Search Window must be placed within the observed band. If partially out of the observed Band a warning is generated. If completely outside of the observed Band an exception is generated. | | | |
| | type | <i>integer</i> | | |
| • tdc_enable | Enable / disable Transient Data Capture for the Search Window. | | | |
| | type | <i>boolean</i> | | |
| • tdc_num_bits | Number of bits per sample (for the Transient Data Capture). Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_before_epoch | Users can trade the period of time for which data are saved and transmitted for the sample bit-width and/or the number of Search Windows. The exact information regarding the memory capacity per receptor and supported range will be provided in construction. The epoch is specified in the command that triggers TDC off-loading (transmission of data). | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_after_epoch | see <i>tdcPeriodBeforeEpoch</i> | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_destination_addresses | Destination addresses (MAC, IP, port) for off-loading of the content of the Transient Data Capture Buffer, specified per receptor. The destination addresses for the content of the Transient Data Capture can be provided either as a part of the scan configuration or by the command that triggers transmission of the captured data. The latter, if provided, overrides previously set addresses. Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | anyOf | type | <i>integer</i> |
| | | | type | <i>string</i> |
| additionalProperties | False | | | |

PSS configuration 2.3

| | | |
|-------------------------------|--|----------------|
| type | <i>object</i> | |
| properties | | |
| • beam_bandwidth | Beam bandwidth (MHz) | |
| | type | <i>integer</i> |
| • chan-nels_per_beam | Number of channels per beam | |
| | type | <i>integer</i> |
| • accelera-tion_search | Processing Mode: Acceleration Search (a.k.a. Pulsar Search) and Single Pulse Search (a.k.a. Transient Search) can be performed concurrently. | |
| | type | <i>boolean</i> |
| • sin-gle_pulse_search | Processing Mode: Acceleration Search (a.k.a. Pulsar Search) and Single Pulse Search (a.k.a. Transient Search) can be performed concurrently. | |
| | type | <i>boolean</i> |

Table 10 – continued from previous page

| | | |
|-------------------------------------|---|----------------|
| • integration_time | Scan duration. | |
| | type | <i>integer</i> |
| • acc_range | Range in source acceleration to be searched. | |
| | type | <i>integer</i> |
| | default | null |
| • number_of_trials | Number of trials to be performed. | |
| | type | <i>integer</i> |
| • time_resolution | Time resolution of input data. | |
| | type | <i>integer</i> |
| • ps_dm | Dispersion correction for acceleration search. | |
| | type | <i>number</i> |
| • sps_dm | Dispersion correction for transient search. | |
| | type | <i>number</i> |
| • timesam- ple_per_block | Number of time samples in each block of data. | |
| | type | <i>integer</i> |
| • sub_bands | Number of frequency band groups summed up during folding. | |
| | type | <i>integer</i> |
| • buffer_size | Size of the buffer receiving raw data. (2**buffer_size) | |
| | type | <i>integer</i> |
| • hsum_control | Number of the “harmonic folds” on the initial Fourier power-spectrum summed up. | |
| | type | <i>integer</i> |
| • cxft_control | CXFT control parameters. | |
| | type | <i>object</i> |
| • cand_sift | Constraints on matches between candidates. | |
| | type | <i>object</i> |
| • cand_output | Define data sinks and subscriber to be notified. | |
| | type | <i>object</i> |
| • sp_threshold | Threshold for a single pulse trigger. (Tuned to system noise and RFI env.) | |
| | type | <i>number</i> |
| • sp_opt_pars | Single pulse optimization parameters. | |
| | type | <i>object</i> |
| • dred_beam_stats | DRED: statistics of spectra to derive the normalization factors. | |
| | type | <i>object</i> |
| • cdos_control | CDOS: control parameters and related statistical data. | |
| | type | <i>object</i> |
| • rfim_control | RFIM control parameters. | |
| | type | <i>object</i> |
| • fldo_control | FLDO control parameters. | |
| | type | <i>object</i> |
| | properties | |
| | • phase_split | <i>boolean</i> |
| | • channel_scale | <i>boolean</i> |
| | • max_phases | <i>integer</i> |
| | additionalProperties | True |
| • beam | type | <i>array</i> |

|----------------------|-------|----------------------------|
| | items | <i>PSS beam config 2.3</i> |
| additionalProperties | False | |

PSS beam config 2.3

| | | | |
|----------------------|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • beam_id | Search Beam ID. | | |
| | type | <i>integer</i> | |
| • ra | Right Ascension of sub-array beam target, in degrees. | | |
| | type | <i>number</i> | |
| | default | null | |
| • dec | Declination of sub-array beam target, in degrees. | | |
| | type | <i>number</i> | |
| | default | null | |
| • reference_frame | reference frame for pointing coordinates | | |
| | default | null | |
| | allOf | type | <i>string</i> |
| | | enum | ICRS, HORIZON |
| • centre_frequency | Centre frequency of the search beam. | | |
| | type | <i>number</i> | |
| • beam_delay_centre | Beam delay center, relative to the array delay center. | | |
| | anyOf | type | <i>number</i> |
| | | type | <i>string</i> |
| • dest_host | Per beam destination host address for PSS output. | | |
| | type | <i>string</i> | |
| | default | null | |
| • dest_port | Per beam destination port for PSS output. | | |
| | type | <i>integer</i> | |
| | default | null | |
| additionalProperties | False | | |

PST scan configuration 2.3

Pulsar Timing specific scan configuration parameters.

| | | |
|--------------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| | default | null |

continues on next page

Table 11 – continued from previous page

| | | |
|---------------------------------|---|---|
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |

continues on next page

Table 11 – continued from previous page

| | | | |
|------------------------------|---|--------|-------------------|
| • source | The name of the source. Keyword: SRC_NAME | | |
| | type | string | |
| • itrfrf | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | | |
| | type | array | |
| | items | type | number |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | | |
| | type | string | |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | | |
| | allOf | type | string |
| | | enum | LIN, CIRC |
| • feed_handedness | Code for sense of feed. For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky). For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA). For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe. Range: -1 or +1 Keyword: FD_HAND | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| • feed_angle | Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver). Units: degrees Range: -180 to 180. Keyword: FD_SANG | | |
| | type | number | |
| • feed_tracking_mode | The tracking mode for the feed: mode FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. <ul style="list-style-type: none">• CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north.• SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation.• TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. Range: FA, CPA, SPA, or TPA Keyword: FD_MODE | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| • feed_position_angle | The requested angle of feed reference. If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'. Range: -180 to +180. Keyword: FA_REQ | | |
| | type | number | |

continues on next page

Table 11 – continued from previous page

| | | | | |
|---------------------------------|--|---------|---------|---------|
| • oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Range: 8/7 or 4/3 Keyword: OVERSAMP | | | |
| | type | array | | |
| | items | type | integer | |
| • coordinates | The tied-array beam's tracking co-ordinates. As of version 2.2 of the schema this only handles equitorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future. <i>PST RA_Dec coordinates 2.3</i> | | | |
| • max_scan_length | The maximum length of the observation. Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX | | | |
| | type | number | | |
| • subint_duration | The length of each output sub-integration. Units: seconds Range: 1 - 60 Keyword: OUTSUBINT | | | |
| | type | number | | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | |
| | type | array | | |
| | items | type | string | |
| • receptor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | |
| | type | array | | |
| | items | type | number | |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | |
| | type | integer | | |
| | default | 0 | | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | |
| | type | array | | |
| | default | null | | |
| | items | type | array | |
| | | items | type | number |
| • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | | |
| | type | array | | |
| | default | null | | |
| | items | anyOf | type | string |
| | | | type | integer |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | |
| | type | string | | |
| | default | null | | |
| • pt | Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration. | | | |
| | default | null | | |

continues on next page

Table 11 – continued from previous page

| | | |
|-----------------------------|---|---|
| | <i>PST ‘PULSAR_TIMING’ mode configuration 2.3</i> | |
| • ds | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | |
| | default | null |
| | <i>PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.3</i> | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | |
| | default | null |
| | <i>PST ‘FLOW_THROUGH’ mode configuration 2.3</i> | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in FSP and 1 in PST BF. | |
| | Keyword: NSTAGE | |
| | type | integer |
| • channelization_stages | List of configuration for each channelization stage. | |
| | type | array |
| | items | Pulsar Timing specific parameters for channelization stage configuration. |
| | <i>PST channelization stage configuration 2.3</i> | |
| additionalProperties | False | |

PST RA_Dec coordinates 2.3

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|--------|
| type | object | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | number |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is ‘hh:mm:ss.sss’ or ‘ddd.ddd’ Keyword: STT_CTD1 | |
| | type | string |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is ‘hh:mm:ss.sss’ or ‘ddd.ddd’ Keyword: STT_CTD2 | |
| | type | string |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.3

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode. PST spectral kurtosis configuration 2.3 |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.3

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode.

| | | | |
|---|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.3

Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration.

| | | | |
|------------------------------------|--|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 12 – continued from previous page

| | | |
|--------------------------------------|---|---|
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. PST spectral kurtosis configuration 2.3 |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.3

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|--------------------------------------|---|--|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisa- tion_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • num_channels | The number of input channels to be recorded. This value must be less than or equal to the output_frequency_channels. Keyword: NCHAN_FT | |
| type | | <i>integer</i> | |
| • requantisa- tion_length | | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> | |
| | additionalProperties | False | |

PST channelization stage configuration 2.3

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---------------------------------|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| • filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| • num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| • oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.3

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |
|----------------------|---------------|
| type | <i>object</i> |
| properties | |
| additionalProperties | False |

Common configuration schema 2.2

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$</code> |
| | default | null |
| • band_5_tuning | Center frequency for the Band-of-Interest. Required if Band is 5a or 5b; not specified for other Bands (not configurable for Band 1, 2, 3 and 4). Input for Band 5a and 5b consists of two 2.5 GHz streams; the center frequency can be independently tuned for each stream. The following nomenclature is used to refer to Band 5a and 5b streams: 5a1, 5a2, 5b1, 5b2. | |
| | type | <i>array</i> |
| | default | null |
| | items | type <i>number</i> |
| • frequency_band | Frequency band applies for all the receptors (VCCs) that belong to the sub-array. | |
| | type | <i>string</i> |
| | pattern | <code>^(1 2 3 4 5(a b))\$</code> |
| additionalProperties | False | |

CBF config 2.2

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-element. This section is forwarded only to CBF subelement. Most of it to be borrowed from IICD

| type | object | | |
|---|---|---|------|
| properties | | | |
| <ul style="list-style-type: none">frequency_band_offset_stream1 | Optionally, an offset can be specified so that the entire observed band is shifted (to accommodate a Zoom Window that crosses a ‘natural’ Frequency Slice boundary). If specified, applies for all the receptors in the sub-array. Bands 1, 2, 3 and 4: input from the receptor consists of a single data stream; the Frequency Band Offset (FBO) should be specified for Stream 1 only. Bands 5a and 5b: input from the receptor consists of two data streams; the FBO can be specified for each stream independently. Note: For Band 5a and 5b the frequency shift is performed by the receptor (DISH). Note: This is optional and does not need to be implemented in PI3, but would be great for demo; if Team Buttons is looking for opportunities to showcase interesting GUIs, Zoom Windows are perfect opportunity (would require TMC and CSP to support these two parameters, corrBandwidth values > 0 and zoom window tuning.) | | |
| | type | integer | |
| | default | null | |
| | | | |
| <ul style="list-style-type: none">frequency_band_offset_stream2 | See frequencyBandOffsetStream1 | | |

| | | items | anyOf | type | integer |
| | | | | type | string |
| additionalProp- erties | False | | | | |

VLBI config 2.2

Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| additionalProperties | False | |

Search window config 2.2

Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.

| | | | | |
|------------------------------------|--|----------------|------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • search_window_id | Identifier of the 300MHz Search Window. Unique within a sub-array. | | | |
| | type | <i>integer</i> | | |
| • search_window_tuning | The Search Window tuning is provided in absolute terms as RF center frequency. The Search Window must be placed within the observed band. If partially out of the observed Band a warning is generated. If completely outside of the observed Band an exception is generated. | | | |
| | type | <i>integer</i> | | |
| • tdc_enable | Enable / disable Transient Data Capture for the Search Window. | | | |
| | type | <i>boolean</i> | | |
| • tdc_num_bits | Number of bits per sample (for the Transient Data Capture). Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_before_epoch | Users can trade the period of time for which data are saved and transmitted for the sample bit-width and/or the number of Search Windows. The exact information regarding the memory capacity per receptor and supported range will be provided in construction. The epoch is specified in the command that triggers TDC off-loading (transmission of data). | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_after_epoch | see <i>tdcPeriodBeforeEpoch</i> | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_destination_addresses | Destination addresses (MAC, IP, port) for off-loading of the content of the Transient Data Capture Buffer, specified per receptor. The destination addresses for the content of the Transient Data Capture can be provided either as a part of the scan configuration or by the command that triggers transmission of the captured data. The latter, if provided, overrides previously set addresses. Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>array</i> | | |

Table 15 – continued from previous page

| | | | |
|---------------------------------|---|----------------|---|
| | type | <i>integer</i> | |
| • subarray_id | The ID for the sub-array. Keyword: SUBARRAY_ID | | |
| | type | <i>string</i> | |
| • tim- ing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | | |
| | type | <i>string</i> | |
| | default | null | |
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | | |
| | type | <i>integer</i> | |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | | |
| | type | <i>integer</i> | |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSAMP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | | |
| | type | <i>integer</i> | |
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | | |
| | type | <i>integer</i> | |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | | |
| | type | <i>integer</i> | |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | | |
| | type | <i>integer</i> | |
| • cen- tre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | | |
| | type | <i>number</i> | |
| • to- tal_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | | |
| | type | <i>number</i> | |
| • observa- tion_mode | The observation mode used for the scan. Range: PULSAR_TIMING, DYNAMIC_SPECTRUM, or FLOW_THROUGH Keyword: OBSMODE | | |
| | allOf | type | <i>string</i> |
| | | enum | PULSAR_TIMING, DY- NAMIC_SPECTRUM, FLOW_THROUGH |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | | |

| | | | |
|----------------------|---|--------|-------------------|
| | type | string | |
| • project_id | The project that the observations are for. Keyword: PROJID | | |
| | type | string | |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | | |
| | type | string | |
| • source | The name of the source. Keyword: SRC_NAME | | |
| | type | string | |
| • itrfr | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | | |
| | type | array | |
| | items | type | number |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | | |
| | type | string | |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | | |
| | allOf | type | string |
| | | enum | LIN, CIRC |
| • feed_handedness | Code for sense of feed. For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky). For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA). For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe. Range: -1 or +1 Keyword: FD_HAND | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| • feed_angle | Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver). Units: degrees Range: -180 to 180. Keyword: FD_SANG | | |
| | type | number | |
| • feed_tracking_mode | The tracking mode for the feed: mode FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. • CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north. • SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation. • TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. Range: FA, CPA, SPA, or TPA Keyword: FD_MODE | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |

Table 15 – continued from previous page

| | | | |
|-----------------------------------|---|---------|---------|
| • feed_position_angle | The requested angle of feed reference. If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'. Range: -180 to +180. Keyword: FA_REQ | | |
| | type | number | |
| • oversam- pling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Range: 8/7 or 4/3 Keyword: OVERSAMP | | |
| | type | array | |
| | items | type | integer |
| • coordinates | The tied-array beam's tracking co-ordinates. As of version 2.2 of the schema this only handles equitorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future. PST RA_Dec coordinates 2.2 | | |
| | | | |
| • max_scan_length | The maximum length of the observation. Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX | | |
| | type | number | |
| • subint_duration | The length of each output sub-integration. Units: seconds Range: 1 - 60 Keyword: OUTSUBINT | | |
| | type | number | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | |
| | type | array | |
| | items | type | string |
| • recep- tor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | |
| | type | array | |
| | items | type | number |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | |
| | type | integer | |
| | default | 0 | |
| • rfi_frequency_masks | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges contain- ing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | |
| | type | array | |
| | default | null | |
| | items | type | array |
| | | items | type |
| • cal_mode | Operation mode for the injected calibration: <ul style="list-style-type: none">• OFF: there is no injected calibration.• SYNC: the calibration is pulsed synchronously with the folding frequency.• EXT1/EXT2: the calibration is driven by one of two possible user defined external signals. Range: [OFF, SYNC, EXT1, EXT2] Keyword: CAL_MODE | | |

continues on next page

Table 15 – continued from previous page

| | | | | |
|------------------------------------|--|--------|-----------------------|--------|
| | default | null | | |
| | allOf | type | string | |
| | | enum | OFF, SYNC, EXT1, EXT2 | |
| • calibration_modulation_frequency | The modulation frequency for the injected calibration signal. Range: 0 - 1000 Units: Hertz Keyword: CAL_FREQ | | | |
| | type | number | | |
| | default | null | | |
| • calibration_duty_cycle | Duty cycle for the injected calibration signal. Range: 0.0 - 1.0 Keyword: CAL_DCYC | | | |
| | type | number | | |
| | default | null | | |
| • calibration_phase | The calibration phase with respect to time. Phase of the leasing edge of the injected calibration signal in calibration SYNC mode. Range: 0.0 - 1.0 Keyword: CAL_PHS | | | |
| | type | number | | |
| | default | null | | |
| • calibration_num_phase | The number of pulses in one period of the calibration phase. Keyword: CAL_NPHS | | | |
| | type | number | | |
| | default | null | | |
| • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | | |
| | type | array | | |
| | default | null | | |
| | items | anyOf | type | string |
| | | type | integer | |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | |
| | type | string | | |
| | default | null | | |
| • pt | Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration. | | | |
| | default | null | | |
| • ds | <i>PST ‘PULSAR_TIMING’ mode configuration 2.2</i> | | | |
| | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | | | |
| | default | null | | |
| • ft | <i>PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.2</i> | | | |
| | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | | | |
| | default | null | | |
| | <i>PST ‘FLOW_THROUGH’ mode configuration 2.2</i> | | | |
| | additionalProperties | | | |
| False | | | | |

PST RA_Dec coordinates 2.2

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.2

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode. |
| | | <i>PST spectral kurtosis configuration 2.2</i> |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.2

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode.

| | | | |
|---|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST 'DYNAMIC_SPECTRUM' mode configuration 2.2

Pulsar Timing specific parameters for the 'DYNAMIC_SPECTRUM' mode configuration.

| | | | |
|--------------------------------------|---|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 16 – continued from previous page

| | | |
|-------------------------|--|--|
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.2</i> |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.2

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|--------------------------------------|---|--|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisa- tion_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • num_channels | The number of input channels to be recorded. This value must be less than or equal to the output_frequency_channels. Keyword: NCHAN_FT | |
| type | | <i>integer</i> | |
| • requantisa- tion_length | | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> | |
| | additionalProperties | False | |

PST beam configuration 2.2

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | | |
|------------------------------------|---|---|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration in UTC. Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in LFAA and 1 in CBF * for Mid, there are 2 stages: 1 in FSP and 1 in PST BF. Keyword: NSTAGE | |
| | type | <i>integer</i> |
| • channelization_stages | List of configuration for each channelization stage. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for channelization stage configuration. |
| | | <i>PST channelization stage configuration 2.2</i> |
| additionalProperties | False | |

PST channelization stage configuration 2.2

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

Common configuration schema 2.1

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$</code> |
| | default | null |
| • band_5_tuning | Center frequency for the Band-of-Interest. Required if Band is 5a or 5b; not specified for other Bands (not configurable for Band 1, 2, 3 and 4). Input for Band 5a and 5b consists of two 2.5 GHz streams; the center frequency can be independently tuned for each stream. The following nomenclature is used to refer to Band 5a and 5b streams: 5a1, 5a2, 5b1, 5b2. | |
| | type | <i>array</i> |
| | default | null |
| | items | type <i>number</i> |
| • frequency_band | Frequency band applies for all the receptors (VCCs) that belong to the sub-array. | |
| | type | <i>string</i> |
| | pattern | <code>^(1 2 3 4 5(a b))\$</code> |
| additionalProperties | False | |

CBF config 2.1

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-element. This section is forwarded only to CBF subelement. Most of it to be borrowed from IICD

| type | <i>object</i> | |
|---|---|---|
| properties | | |
| <ul style="list-style-type: none">• frequency_band_offset_stream1 | Optionally, an offset can be specified so that the entire observed band is shifted (to accommodate a Zoom Window that crosses a ‘natural’ Frequency Slice boundary). If specified, applies for all the receptors in the sub-array. Bands 1, 2, 3 and 4: input from the receptor consists of a single data stream; the Frequency Band Offset (FBO) should be specified for Stream 1 only. Bands 5a and 5b: input from the receptor consists of two data streams; the FBO can be specified for each stream independently. Note: For Band 5a and 5b the frequency shift is performed by the receptor (DISH). Note: This is optional and does not need to be implemented in PI3, but would be great for demo; if Team Buttons is looking for opportunities to showcase interesting GUIs, Zoom Windows are perfect opportunity (would require TMC and CSP to support these two parameters, corrBandwidth values > 0 and zoom window tuning.) | |
| | type | <i>integer</i> |
| | default | null |
| <ul style="list-style-type: none">• frequency_band_offset_stream2 | See <i>frequencyBandOffsetStream1</i> | |
| | type | <i>integer</i> |
| | default | null |
| <ul style="list-style-type: none">• delay_model_subscription_point | FQDN of TMC.DelayModel TANGO attribute which exposes delay values for all the dishes assigned to a Subarray in JSON format. Delay values are updated every 10 seconds. | |
| | type | <i>string</i> |
| | default | null |
| <ul style="list-style-type: none">• doppler_phase_corr_subscription_point | The same model applies for all receptors that belong to the subarray. Defined by TMC using publish-subscribe mechanism (see ICD Section 3.8.8.5.3). The Doppler phase correction, by default, applies only to the CSP_Mid Processing Mode Correlation; optionally may apply to other Processing Modes as well. | |
| | type | <i>string</i> |
| | default | null |
| <ul style="list-style-type: none">• rfi_flagging_mask | Specified as needed in advance of the scan start and/or during the scan. Delivered using publish-subscribe mechanism (see ICD Section 3.8.8.5.7). | |
| | type | <i>object</i> |
| | default | null |
| | properties | |
| | additionalProperties | True |
| <ul style="list-style-type: none">• fsp | type | <i>array</i> |
| | items | <i>FSP config 2.1</i> |
| <ul style="list-style-type: none">• vlbi | Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement. | |
| | default | null |
| | <i>VLBI config 2.1</i> | |
| <ul style="list-style-type: none">• search_window | type | <i>array</i> |
| | default | null |
| | items | Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming. |
| | <i>Search window config 2.1</i> | |

Table 17 – continued from previous page

| | | | | | |
|---------------------------|---------|-------|-------|------|---------|
| | default | null | | | |
| | items | type | array | | |
| | | items | anyOf | type | integer |
| | | | | type | string |
| additionalProp- erties | False | | | | |

VLBI config 2.1

Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| additionalProperties | False | |

Search window config 2.1

Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.

| | | | | |
|------------------------------------|--|----------------|------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • search_window_id | Identifier of the 300MHz Search Window. Unique within a sub-array. | | | |
| | type | <i>integer</i> | | |
| • search_window_tuning | The Search Window tuning is provided in absolute terms as RF center frequency. The Search Window must be placed within the observed band. If partially out of the observed Band a warning is generated. If completely outside of the observed Band an exception is generated. | | | |
| | type | <i>integer</i> | | |
| • tdc_enable | Enable / disable Transient Data Capture for the Search Window. | | | |
| | type | <i>boolean</i> | | |
| • tdc_num_bits | Number of bits per sample (for the Transient Data Capture). Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_before_epoch | Users can trade the period of time for which data are saved and transmitted for the sample bit-width and/or the number of Search Windows. The exact information regarding the memory capacity per receptor and supported range will be provided in construction. The epoch is specified in the command that triggers TDC off-loading (transmission of data). | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_after_epoch | see <i>tdcPeriodBeforeEpoch</i> | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_destination_addresses | Destination addresses (MAC, IP, port) for off-loading of the content of the Transient Data Capture Buffer, specified per receptor. The destination addresses for the content of the Transient Data Capture can be provided either as a part of the scan configuration or by the command that triggers transmission of the captured data. The latter, if provided, overrides previously set addresses. Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | anyOf | type | <i>integer</i> |
| | | | type | <i>string</i> |
| additionalProperties | False | | | |

PSS configuration 2.1

| | | |
|-------------------------------|--|----------------|
| type | <i>object</i> | |
| properties | | |
| • beam_bandwidth | Beam bandwidth (MHz) | |
| | type | <i>integer</i> |
| • chan-nels_per_beam | Number of channels per beam | |
| | type | <i>integer</i> |
| • accelera-tion_search | Processing Mode: Acceleration Search (a.k.a. Pulsar Search) and Single Pulse Search (a.k.a. Transient Search) can be performed concurrently. | |
| | type | <i>boolean</i> |
| • sin-gle_pulse_search | Processing Mode: Acceleration Search (a.k.a. Pulsar Search) and Single Pulse Search (a.k.a. Transient Search) can be performed concurrently. | |
| | type | <i>boolean</i> |

Common configuration schema 2.0

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | | |
|----------------------|--|---|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • config_id | type | <i>string</i> | |
| | default | null | |
| • subarray_id | Subarray number | | |
| | type | <i>integer</i> | |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | | |
| | type | <i>string</i> | |
| | pattern | ^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| | default | null | |
| | • band_5_tuning | Center frequency for the Band-of-Interest. Required if Band is 5a or 5b; not specified for other Bands (not configurable for Band 1, 2, 3 and 4). Input for Band 5a and 5b consists of two 2.5 GHz streams; the center frequency can be independently tuned for each stream. The following nomenclature is used to refer to Band 5a and 5b streams: 5a1, 5a2, 5b1, 5b2. | |
| type | | <i>array</i> | |
| default | | null | |
| items | | type | <i>number</i> |
| • frequency_band | | Frequency band applies for all the receptors (VCCs) that belong to the sub-array. | |
| | type | <i>string</i> | |
| | pattern | ^(1 2 3 4 5(a b))\$ | |
| additionalProperties | False | | |

CBF config 2.0

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-element. This section is forwarded only to CBF subelement. Most of it to be borrowed from IICD

| type | object | |
|---|---|---|
| properties | | |
| <ul style="list-style-type: none">frequency_band_offset_stream1 | <p>Optionally, an offset can be specified so that the entire observed band is shifted (to accommodate a Zoom Window that crosses a ‘natural’ Frequency Slice boundary). If specified, applies for all the receptors in the sub-array. Bands 1, 2, 3 and 4: input from the receptor consists of a single data stream; the Frequency Band Offset (FBO) should be specified for Stream 1 only. Bands 5a and 5b: input from the receptor consists of two data streams; the FBO can be specified for each stream independently. Note: For Band 5a and 5b the frequency shift is performed by the receptor (DISH). Note: This is optional and does not need to be implemented in PI3, but would be great for demo; if Team Buttons is looking for opportunities to showcase interesting GUIs, Zoom Windows are perfect opportunity (would require TMC and CSP to support these two parameters, corrBandwidth values > 0 and zoom window tuning.)</p> | |
| | type | integer |
| | default | null |
| <ul style="list-style-type: none">frequency_band_offset_stream2 | See <i>frequencyBandOffsetStream1</i> | |
| | type | integer |
| | default | null |
| <ul style="list-style-type: none">delay_model_subscription_point | FQDN of TMC.DelayModel TANGO attribute which exposes delay values for all the dishes assigned to a Subarray in JSON format. Delay values are updated every 10 seconds. | |
| | type | string |
| | default | null |
| <ul style="list-style-type: none">doppler_phase_corr_subscription_point | The same model applies for all receptors that belong to the subarray. Defined by TMC using publish-subscribe mechanism (see ICD Section 3.8.8.5.3). The Doppler phase correction, by default, applies only to the CSP_Mid Processing Mode Correlation; optionally may apply to other Processing Modes as well. | |
| | type | string |
| | default | null |
| <ul style="list-style-type: none">rfi_flagging_mask | Specified as needed in advance of the scan start and/or during the scan. Delivered using publish-subscribe mechanism (see ICD Section 3.8.8.5.7). | |
| | type | object |
| | default | null |
| | properties | |
| | additionalProperties | True |
| <ul style="list-style-type: none">fsp | type | array |
| | items | <i>FSP config 2.0</i> |
| <ul style="list-style-type: none">vlbi | Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement. | |
| | default | null |
| | <i>VLBI config 2.0</i> | |
| <ul style="list-style-type: none">search_window | type | array |
| | default | null |
| | items | Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming. |
| | | <i>Search window config 2.0</i> |
| additionalProperties | False | |

FSP config 2.0

| | | | | |
|--------------------------------|--|--|---|--|
| type | <i>object</i> | | | |
| properties | | | | |
| • fsp_id | type | <i>integer</i> | | |
| • func- tion_mode | allOf | type | <i>string</i> | |
| | | enum | CORR, PSS-BF, PST-BF, VLBI | |
| • receptors | Optionally a subset of receptors to be correlated can be specified. If not specified, all receptors that belong to the subarray are cross-correlated (i.e. visibilities for all the baselines in the subarray are generated and transmitted to SDP). Valid receptor IDs include: SKA dishes: “SKAnnn”, where nnn is a zero padded integer in the range of 001 to 133. MeerKAT dishes: “MKTnnn”, where nnn is a zero padded integer in the range of 000 to 063. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | type | <i>string</i> | |
| | | pattern | ^(SKA(00[1-9][0[1-9]][0-9][1[0-2][0-9]13[0-3])) (MKT(0[0-5][0-9]06[0-3]))\$ | |
| • fre- quency_slice | Frequency Slice to be processed on this FSP (valid range depends on the Frequency Band). | | | |
| • zoom_factor | type | <i>integer</i> | | |
| | Bandwidth to be correlated calculated as FSBW/2n, where n is in range [0..6]. When n=0 the full Frequency Slice bandwidth is correlated. BW > 0 implies ‘Zoom Window’ configuration; the spectral Zoom Window tuning must be specified. | | | |
| | type | <i>integer</i> | | |
| • zoom_window | The Zoom Window tuning provided in absolute terms as RF center frequency. Based on that, CSB-Mid calculates tuning within the data stream received from the receptor. Must be selected so that the entire Zoom Window is within the Frequency Slice. If partially out of the FS a warning is generated. If completely outside of the FS an exception is generated. Step size <= 0.01MHz. The Frequency Band Offset can be used to shift the entire observed band in order to accommodate a Zoom Window that spans across a Frequency Slice boundary. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| | • integra- tion_factor | Integration time for the correlation products, defines multiple of 140 milliseconds. | | |
| | type | <i>integer</i> | | |

Table 19 – continued from previous page

| | | | | | |
|---------------------------|---------|-------|-------|------|---------|
| | default | null | | | |
| | items | type | array | | |
| | | items | anyOf | type | integer |
| | | | | type | string |
| additionalProp- erties | False | | | | |

VLBI config 2.0

Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| additionalProperties | False | |

Search window config 2.0

Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.

| | | | | |
|------------------------------------|--|----------------|------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • search_window_id | Identifier of the 300MHz Search Window. Unique within a sub-array. | | | |
| | type | <i>integer</i> | | |
| • search_window_tuning | The Search Window tuning is provided in absolute terms as RF center frequency. The Search Window must be placed within the observed band. If partially out of the observed Band a warning is generated. If completely outside of the observed Band an exception is generated. | | | |
| | type | <i>integer</i> | | |
| • tdc_enable | Enable / disable Transient Data Capture for the Search Window. | | | |
| | type | <i>boolean</i> | | |
| • tdc_num_bits | Number of bits per sample (for the Transient Data Capture). Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_before_epoch | Users can trade the period of time for which data are saved and transmitted for the sample bit-width and/or the number of Search Windows. The exact information regarding the memory capacity per receptor and supported range will be provided in construction. The epoch is specified in the command that triggers TDC off-loading (transmission of data). | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_after_epoch | see <i>tdcPeriodBeforeEpoch</i> | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_destination_addresses | Destination addresses (MAC, IP, port) for off-loading of the content of the Transient Data Capture Buffer, specified per receptor. The destination addresses for the content of the Transient Data Capture can be provided either as a part of the scan configuration or by the command that triggers transmission of the captured data. The latter, if provided, overrides previously set addresses. Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | anyOf | type | <i>integer</i> |
| | | | type | <i>string</i> |
| additionalProperties | False | | | |

PSS configuration 2.0

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| | default | null |
| additionalProperties | False | |

| additionalProperties | False | |

Common configuration schema 1.0

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | | |
|----------------------|--|---|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • id | type | <i>string</i> | |
| | default | null | |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | | |
| | type | <i>string</i> | |
| | pattern | ^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| | default | null | |
| | • band5Tuning | Center frequency for the Band-of-Interest. Required if Band is 5a or 5b; not specified for other Bands (not configurable for Band 1, 2, 3 and 4). Input for Band 5a and 5b consists of two 2.5 GHz streams; the center frequency can be independently tuned for each stream. The following nomenclature is used to refer to Band 5a and 5b streams: 5a1, 5a2, 5b1, 5b2. | |
| type | | <i>array</i> | |
| default | | null | |
| items | | type | <i>number</i> |
| • frequencyBand | | Frequency band applies for all the receptors (VCCs) that belong to the sub-array. | |
| | type | <i>string</i> | |
| | pattern | ^(1 2 3 4 5(a b))\$ | |
| • subarrayID | Subarray number | | |
| | type | <i>integer</i> | |
| additionalProperties | False | | |

CBF config 1.0

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF subelement. This section is forwarded only to CBF subelement. Most of it to be borrowed from IICD

| | | |
|-------------------------------------|---|--|
| type | <i>object</i> | |
| properties | | |
| • frequencyBandOffsetStream1 | <p>Optionally, an offset can be specified so that the entire observed band is shifted (to accommodate a Zoom Window that crosses a ‘natural’ Frequency Slice boundary). If specified, applies for all the receptors in the sub-array. Bands 1, 2, 3 and 4: input from the receptor consists of a single data stream; the Frequency Band Offset (FBO) should be specified for Stream 1 only. Bands 5a and 5b: input from the receptor consists of two data streams; the FBO can be specified for each stream independently. Note: For Band 5a and 5b the frequency shift is performed by the receptor (DISH). Note: This is optional and does not need to be implemented in PI3, but would be great for demo; if Team Buttons is looking for opportunities to showcase interesting GUIs, Zoom Windows are perfect opportunity (would require TMC and CSP to support these two parameters, corrBandwidth values > 0 and zoom window tuning.)</p> | |
| | type | <i>integer</i> |
| | default | null |
| • frequencyBandOffsetStream2 | See <i>frequencyBandOffsetStream1</i> | |
| | type | <i>integer</i> |
| | default | null |
| • delayModelSubscription-Point | <p>FQDN of TMC.DelayModel TANGO attribute which exposes delay values for all the dishes assigned to a Subarray in JSON format. Delay values are updated every 10 seconds.</p> | |
| | type | <i>string</i> |
| | default | null |
| • dopplerPhaseCorrSubscriptionPoint | <p>The same model applies for all receptors that belong to the subarray. Delivered by TMC using publish-subscribe mechanism (see ICD Section 3.8.8.5.3). The Doppler phase correction, by default, applies only to the CSP_Mid Processing Mode Correlation; optionally may apply to other Processing Modes as well.</p> | |
| | type | <i>string</i> |
| | default | null |
| • rfiFlaggingMask | <p>Specified as needed in advance of the scan start and/or during the scan. Delivered using publish-subscribe mechanism (see ICD Section 3.8.8.5.7).</p> | |
| | type | <i>object</i> |
| | default | null |
| | properties | |
| | additionalProperties | True |
| • fsp | type | <i>array</i> |
| | items | FSP config 1.0 |
| • vlbi | <p>Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.</p> | |
| | default | null |
| | VLBI config 1.0 | |
| • search_window | type | <i>array</i> |
| | default | null |
| | items | <p>Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.</p> |
| | Search window config 1.0 | |
| additionalProperties | False | |

FSP config 1.0

| | | | | |
|---------------------------|--|----------------|---|--|
| type | <i>object</i> | | | |
| properties | | | | |
| • fspID | type | <i>integer</i> | | |
| • function-Mode | allOf | type | <i>string</i> | |
| | | enum | CORR, PSS-BF, PST-BF, VLBI | |
| • receptors | Optionally a subset of receptors to be correlated can be specified. If not specified, all receptors that belong to the subarray are cross-correlated (i.e. visibilities for all the baselines in the subarray are generated and transmitted to SDP). Valid receptor IDs include: SKA dishes: “SKAnnn”, where nnn is a zero padded integer in the range of 001 to 133. MeerKAT dishes: “MKTnnn”, where nnn is a zero padded integer in the range of 000 to 063. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | type | <i>string</i> | |
| | | pattern | ^(SKA(00[1-9][0[1-9]][0-9][1[0-2]][0-9][13[0-3]]) (MKT(0[0-5][0-9][06[0-3]]))\$ | |
| • frequencySliceID | Frequency Slice to be processed on this FSP (valid range depends on the Frequency Band). | | | |
| | type | <i>integer</i> | | |
| • cor-rBand-width | Bandwidth to be correlated calculated as FSBW/2n, where n is in range [0..6]. When n=0 the full Frequency Slice bandwidth is correlated. BW > 0 implies ‘Zoom Window’ configuration; the spectral Zoom Window tuning must be specified. | | | |
| | type | <i>integer</i> | | |
| • zoomWindowTuning | The Zoom Window tuning provided in absolute terms as RF center frequency. Based on that, CSP_Mid calculates tuning within the data stream received from the receptor. Must be selected so that the entire Zoom Window is within the Frequency Slice. If partially out of the FS a warning is generated. If completely outside of the FS an exception is generated. Step size <= 0.01MHz. The Frequency Band Offset can be used to shift the entire observed band in order to accommodate a Zoom Window that spans across a Frequency Slice boundary. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • integrationTime | Integration time for the correlation products, defines multiple of 140 milliseconds. | | | |
| | const | 1400 | | |

| | default | null | | | |
| | items | type | array | | |
| | | items | anyOf | type | integer |
| | | | | type | string |
| additionalProp- erties | False | | | | |

VLBI config 1.0

Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| additionalProperties | False | |

Search window config 1.0

Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.

| | | | | |
|--------------------------------|--|----------------|------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • searchWindowID | Identifier of the 300MHz Search Window. Unique within a sub-array. | | | |
| | type | <i>integer</i> | | |
| • searchWindowTuning | The Search Window tuning is provided in absolute terms as RF center frequency. The Search Window must be placed within the observed band. If partially out of the observed Band a warning is generated. If completely outside of the observed Band an exception is generated. | | | |
| | type | <i>integer</i> | | |
| • tdcEnable | Enable / disable Transient Data Capturefor the Search Window. | | | |
| | type | <i>boolean</i> | | |
| • tdcNumBits | Number of bits per sample (for the Transient Data Capture). Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdcPeriodBeforeEpoch | Users can trade the period of time for which data are saved and transmitted for the sample bit-width and/or the number of Search Windows. The exact information regarding the memory capacity per receptor and supported range will be provided in construction. The epoch is specified in the command that triggers TDC off-loading (transmission of data). | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdcPeriodAfterEpoch | see <i>tdcPeriodBeforeEpoch</i> | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdcDestinationAddress | Destination addresses (MAC, IP, port) for off-loading of the content of the Transient Data Capture Buffer, specified per receptor. The destination addresses for the content of the Transient Data Capture can be provided either as a part of the scan configuration or by the command that triggers transmission of the captured data. The latter, if provided, overrides previously set addresses. Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | anyOf | type | <i>integer</i> |
| | | | type | <i>string</i> |
| additionalProperties | False | | | |

| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | <i>string</i> |
| • scan_id | Scan ID to associate with the data. | |
| | type | <i>integer</i> |
| additionalProperties | False | |

ska-csp-endscan

CSP endscan 2.2

Example JSON

```
{
  "interface": "https://schema.skao.int/ska-csp-endscan/2.2",
  "scan_id": 15
}
```

| | | |
|---|---|----------------|
| https://schema.skao.int/ska-csp-endscan/2.2 | | |
| type | <i>object</i> | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | <i>string</i> |
| • scan_id | Scan ID to end. | |
| | type | <i>integer</i> |
| additionalProperties | False | |

ska-csp-releaseresources

CSP releaseresources 2.2

Example JSON

```
{
  "interface": "https://schema.skao.int/ska-csp-releaseresources/2.2",
  "subarray_id": 1,
  "release_all": true,
  "receptor_ids": ["SKA001", "SKA036"]
}
```

| | | | |
|---|---|---------|--|
| https://schema.skao.int/ska-csp-releaseresources/2.2 | | | |
| type | object | | |
| properties | | | |
| • interface | URI of JSON schema applicable to this JSON payload. | | |
| | type | string | |
| • subarray_id | Subarray ID which will have its resource(s) released. | | |
| | type | integer | |
| • release_all | Set to true if you wish to release all resources assigned to the Subarray. | | |
| | type | boolean | |
| | default | null | |
| • receptor_ids | The list of receptors that will be released from the Subarray ID. Receptor IDs can be any string, not necessarily numbers. Valid receptor IDs include: SKA dishes: “SKAnnn”, where nnn is a zero padded integer in the range of 001 to 133. MeerKAT dishes: “MKTnnn”, where nnn is a zero padded integer in the range of 000 to 063. | | |
| | type | array | |
| | default | null | |
| | items | type | string |
| | | pattern | ^(SKA(00[1-9] 0[1-9][0-9] 1[0-2][0-9] 13[0-3])) (MKT(0[0-5][0-9] 06[0-3]))\$ |
| additionalProperties | False | | |

ska-csp-delaymodel

CSP delaymodel 2.2

Example JSON

```
{
  "interface": "https://schema.skao.int/ska-csp-delaymodel/2.2",
  "epoch": 12345678.123456,
  "validity_period": 10.0,
  "delay_details": [{
    "receptor": "SKA001",
    "poly_info": [{
      "polarization": "X",
      "coeffs": [1.01, 1.02, 1.03, 1.04, 1.05, 1.06]
    }, {
      "polarization": "Y",
      "coeffs": [1.1, 1.2, 1.3, 1.4, 1.5, 1.6]
    }
  ]
}, {
  "receptor": "SKA100",
  "poly_info": [{
    "polarization": "X",
    "coeffs": [1.101, 1.102, 1.103, 1.104, 1.105, 1.106]
  }, {
```

(continues on next page)

(continued from previous page)

```

        "polarization": "Y",
        "coeffs": [1.11, 1.12, 1.13, 1.14, 1.15, 1.16]
    }
}

```

| | | |
|--|--|-------------------|
| https://schema.skao.int/ska-csp-delaymodel/2.2 | | |
| type | object | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | string |
| • epoch | Time when delay model becomes valid (when Mid.CBF shall apply the new model) specified as 32bit UTC time code containing a count of seconds in float since the 1999-12-31T23:59:28Z UTC (SKA epoch). Range: 32-bit number | |
| | type | number |
| • validity_period | validity period of the delay model (starting at epoch) [s] Range: positive number | |
| | type | number |
| • delay_details | type | array |
| | items | delay details 2.2 |
| additionalProperties | False | |

delay details 2.2

| | | |
|----------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • receptor | ICD DISH to CSP defines DISH ID as 16 bit field. The receptorID specified in the delay model should be the same as the one inserted in the data stream received from the receptor. Valid receptor IDs include: SKA dishes: “SKAnnn”, where nnn is a zero padded integer in the range of 001 to 133. MeerKAT dishes: “MKTnnn”, where nnn is a zero padded integer in the range of 000 to 063. Range: any string | |
| | type | <i>string</i> |
| | pattern | $\wedge(\text{SKA}(\text{00}[1-9][0-9][0-9])1[0-2][0-9]13[0-3]))(\text{MKT}(0[0-5][0-9]06[0-3]))\$$ |
| • poly_info | type | <i>array</i> |
| | items | <i>poly info 2.2</i> |
| additionalProperties | False | |

poly info 2.2

| | | | |
|-----------------------|--|---------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • polarization | Polarization of the delay model entry Range: X or Y | | |
| | type | <i>string</i> | |
| • coeffs | Delay Model is specified as coefficients for a 5th order polynomial. Coefficients of the polynomial are specified as an array. The delay at time t, where t is measured with respect the beginning of the validity interval is calculated as: $d(t) = c_0 + c_1 * t + c_2 * t^2 + c_3 * t^3 + c_4 * t^4 + c_5 * t^5$ Units for coefficients c0,c1,...c5: ns/s^k where k=0,1,..5 Range for coefficients: 64 bit number | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| additionalProperties | False | | |

ska-csp-low-delaymodel

CSP low delaymodel 1.0

Example JSON

```
{
  "interface": "https://schema.skao.int/ska-low-csp-delaymodel/1.0",
  "start_validity_sec": 748656000.0,
  "cadence_sec": 10.0,
  "validity_period_sec": 600.0,
  "config_id": "sbi-mvp02-20200325-00001-science_A",
  "station_beam": 5,
  "subarray": 2,
  "station_beam_delays": [{
    "station_id": 512,
    "substation_id": 3,
    "xypol_coeffs_ns": [750.0, 0.0046, -2e-06, -4.1e-12, 9e-16, -1.9e-19],
    "ypol_offset_ns": -0.1
  }, {
    "station_id": 1,
    "substation_id": 0,
    "xypol_coeffs_ns": [750.0, 0.0046, -2e-06, -4.1e-12, 9e-16, -1.9e-19],

  }]
}
```

| | | |
|---|---|-------------------------|
| https://schema.skao.int/ska-low-csp-delaymodel/1.0 | | |
| type | object | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. Type: str | |
| | type | string |
| • start_validity_sec | Time when delay model becomes valid Start point of polynomial validity no sensible default. It indicates an epoch, which could be anytime. Type: float | |
| | type | number |
| • cadence_sec | The time in seconds between updates/publications of the delay polynomials. Type: float Range: Non-zero positive number | |
| | type | number |
| • validity_period_sec | Validity period of the delay model (starting at epoch) [s] Type: float Range: Non-zero positive number | |
| | type | number |
| • config_id | A string, should be the same as the equivalent value in the last “configure” JSON. If not it indicates that these are not yet valid polys for the current configuration. Type: str | |
| | type | string |
| • station_beam | The station beams for which the delay polynomials apply to. Type: int Range: Integer from 1-48 inclusive | |
| | type | integer |
| • subarray | The subarray for which the delay polynomials apply to. Type: int Range: Integer from 1-16 inclusive | |
| | type | integer |
| • station_beam_delays | type | array |
| | items | station beam delays 1.0 |
| additionalProperties | False | |

station beam delays 1.0

| | | | |
|--------------------------|---|--|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • station_id | The station ids for which the delay polynomials apply to. Type: int Range: Integer from 1-512 inclusive | | |
| | type | <i>integer</i> | |
| • substation_id | The substation ids for which the delay polynomials apply to. Type: int | | |
| | type | <i>integer</i> | |
| • xypol_coeffs_ns | X coefficient set Delay Model is specified as coefficients for a 5th order polynomial. Coefficients of the polynomial are specified as an array. The delay at time t, where t is measured with respect the beginning of the validity interval is calculated as: $d(t) = c0 + c1*t + c2*t^2 + c3*t^3 + c4*t^4 + c5*t^5$ Units for coefficients c0,c1,...c5: ns/s^k where k=0,1,...5 Type: float Range for coefficients: 64 bit number | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| | • ypol_offset_ns | Offset for the Y polarisation Type: float | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

1.11.2 Low Central Signal Processor schemas

Schemas used for commands for LOW CSP LMC.

ska-low-csp-assignresources

LOWCSP assign resources 3.0

Example (LOW CSP assignresources JSON v. 3.0)

```
{
  "interface": "https://schema.skao.int/ska-low-csp-assignresources/3.0",
  "common": {
    "subarray_id": 1
  },
  "lowcbf": {},
  "pss": {
    "beams_id": [1, 2, 3]
  },
  "pst": {
    "beams_id": [1]
  }
}
```

| | | | | |
|---|---|---|---------|---------|
| https://schema.skao.int/ska-low-csp-assignresources/3.0 | | | | |
| type | object | | | |
| properties | | | | |
| • interface | URI of JSON schema for this command’s JSON payload. | | | |
| | type | string | | |
| • common | LOWCSP subarray id arguments | | | |
| | type | object | | |
| | properties | | | |
| | • subarray_id | subarray id | | |
| | | type | integer | |
| | additionalProperties | False | | |
| • lowcbf | Low CBF resources | | | |
| | LOWCBF assign resources 0.2 | | | |
| • pst | Assign section for PST sub-system | | | |
| | type | object | | |
| | default | null | | |
| | properties | | | |
| | • beams_id | List of PST beam Ids to assign to the subarray. | | |
| | | type | array | |
| | | items | type | integer |
| | additionalProperties | False | | |
| • pss | Assign section for PSS sub-system | | | |
| | type | object | | |
| | default | null | | |
| | properties | | | |
| | • beams_id | List of PSS beam Ids to assign to the subarray. | | |
| | | type | array | |
| | | items | type | integer |
| | additionalProperties | False | | |
| additionalProperties | False | | | |

LOWCBF assign resources 0.2

| | | |
|---|---|---------------|
| type | <i>object</i> | |
| properties | | |
| <ul style="list-style-type: none">dummy_param | LOWCBF assign resources (unused, empty) | |
| | type | <i>string</i> |
| | default | null |
| additionalProperties | False | |

LOWCSP assign resources 2.0

Example (LOW CSP assignresources JSON v. 2.0)

```
{
  "interface": "https://schema.skao.int/ska-low-csp-assignresources/2.0",
  "common": {
    "subarray_id": 1
  },
  "lowcbf": {
    "resources": [{
      "device": "fsp_01",
      "shared": true,
      "fw_image": "pst",
      "fw_mode": "unused"
    }, {
      "device": "p4_01",
      "shared": true,
      "fw_image": "p4.bin",
      "fw_mode": "p4"
    }
  ],
  "pss": {
    "beams_id": [1, 2, 3]
  },
  "pst": {
    "beams_id": [1]
  }
}
```

| | | | | |
|---|---|---------------------------|----------------------|--|

Low CSP specific parameters. This section contains the parameters relevant to configure the Low CSP sub-system.

| | | |
|---|---|---|
| https://schema.skao.int/ska-low-csp-configure/4.0 | | |
| type | <i>object</i> | |
| properties | | |
| • interface | URI of JSON schema for this command's JSON payload.. | |
| | type | <i>string</i> |
| • subarray | Subarray elements | |
| | type | <i>object</i> |
| | properties | |
| | • subarray_name | Name and scope of current subarray the sub-array. |
| | | type <i>string</i> |
| | additionalProperties | False |
| • common | Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements. | |
| | Common configuration schema 4.0 | |
| • lowcbf | Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-system. This section is forwarded only to CBF subelement. | |
| | default | null |
| | LOWCBF subarray configurescan 1.0 | |
| • pss | Section with parameters to configure the PSS sub-system | |
| | default | null |
| | PSS configuration 2.0 | |
| • pst | Section with parameters to configure the PST sub-system. | |
| | default | null |
| | LOW PST configure 2.5 | |
| additionalProperties | False | |

Common configuration schema 4.0

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|---|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | <p>Execution block ID to associate scan configs to an observation.</p> <p>This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation.</p> <p>This ID does not have to be unique for a scan configuration but should be unique for different observations.</p> <p>For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field.</p> | |
| | type | <i>string</i> |

Station beams to correlate 1.0

| | | | | | |
|-------------------------|-----------------------------|----------------|--------------|----------------|----------------|
| type | <i>object</i> | | | | |
| properties | | | | | |
| • | Station Beam ID | | | | |
| • stn_beam_id | type | <i>integer</i> | | | |
| • integration_ms | milliseconds integration | | | | |
| | type | <i>integer</i> | | | |
| • host | SDP channel & IP Address | | | | |
| | type | <i>array</i> | | | |
| | items | type | <i>array</i> | | |
| | | items | anyOf | type | <i>integer</i> |
| | | | | type | <i>string</i> |
| • port | SDP chan & UDP port, stride | | | | |
| | type | <i>array</i> | | | |
| | items | type | <i>array</i> | | |
| | | items | type | <i>integer</i> | |
| • mac | SDP channel & server MAC | | | | |
| | type | <i>array</i> | | | |
| | default | null | | | |
| | items | type | <i>array</i> | | |
| | | items | anyOf | type | <i>integer</i> |
| | | | | type | <i>string</i> |
| additionalProperties | False | | | | |

PSS configuration 2.0

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| | default | null |
| additionalProperties | False | |

LOW PST configure 2.5

Main configuration for the Low CSP Pulsar timing sub-system

| | | | | |
|----------------------|------------------------------------|--|-----------------------------------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • beams | List of PST Beams IDs to configure | | | |
| | type | <i>array</i> | | |
| | items | Parameters to configure the PST sub-system | | |
| | | type | <i>object</i> | |
| | | properties | | |
| | | • beam_id | Configuration for a PST beam ID | |
| | | | type | <i>integer</i> |
| | | • scan | Parameters to configure the scan | |
| | | | <i>PST scan configuration 2.5</i> | |
| | | • beam | Parameter to configure the beam | |
| | | | default | null |
| | | | <i>PST beam configuration 2.5</i> | |
| additionalProperties | False | | | |
| additionalProperties | False | | | |

PST scan configuration 2.5

Pulsar Timing specific scan configuration parameters.

| | | |
|-------------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| | default | null |
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |

continues on next page

Table 24 – continued from previous page

| | | |
|---------------------------------|---|---|
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |
| • source | The name of the source. Keyword: SRC_NAME | |
| | type | <i>string</i> |
| • itrfr | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | |
| | type | <i>array</i> |
| | items | type <i>number</i> |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | |
| | type | <i>string</i> |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | |

continues on next page

Table 24 – continued from previous page

| | | | |
|------------------------------|---|--------|-------------------|
| | allOf | type | string |
| | | enum | LIN, CIRC |
| • feed_handedness | <p>Code for sense of feed.</p> <p>For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky).</p> <p>For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA).</p> <p>For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe.</p> <p>Range: -1 or +1 Keyword: FD_HAND</p> | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| • feed_angle | <p>Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver).</p> <p>Units: degrees Range: -180 to 180. Keyword: FD_SANG</p> | | |
| | type | number | |
| • feed_tracking_mode | <p>The tracking mode for the feed:</p> <ul style="list-style-type: none"> • FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. • CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north. • SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation. • TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. <p>Range: FA, CPA, SPA, or TPA Keyword: FD_MODE</p> | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| • feed_position_angle | <p>The requested angle of feed reference.</p> <p>If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallactic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'.</p> <p>Range: -180 to +180.</p> <p>Keyword: FA_REQ</p> | | |
| | type | number | |
| • oversampling_ratio | <p>The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]).</p> <p>Range: 8/7 or 4/3 Keyword: OVERSAMP</p> | | |
| | type | array | |
| | items | type | integer |
| • coordinates | <p>The tied-array beam's tracking co-ordinates.</p> <p>As of version 2.2 of the schema this only handles equatorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future.</p> <p><i>PST RA_Dec coordinates 2.5</i></p> | | |
| • max_scan_length | <p>The maximum length of the observation.</p> <p>Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX</p> | | |
| | type | number | |
| • subint_duration | <p>The length of each output sub-integration.</p> <p>Units: seconds Range: 1 - 60 Keyword: OUTSUBINT</p> | | |

continues on next page

Table 24 – continued from previous page

| | | | | |
|------------------------------------|---|---|--------|---------|
| | type | number | | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | |
| | type | array | | |
| | items | type | string | |
| • receptor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | |
| | type | array | | |
| | items | type | number | |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | |
| | type | integer | | |
| | default | 0 | | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges to excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | |
| | type | array | | |
| | default | null | | |
| | items | type | array | |
| | | items | type | number |
| | • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | |
| type | | array | | |
| default | | null | | |
| items | | anyOf | type | string |
| | | | type | integer |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | |
| | type | string | | |
| | default | null | | |
| • pt | Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration. | | | |
| | default | null | | |
| | PST ‘PULSAR_TIMING’ mode configuration 2.5 | | | |
| • ds | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | | | |
| | default | null | | |
| | PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.5 | | | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | | | |
| | default | null | | |
| | PST ‘FLOW_THROUGH’ mode configuration 2.5 | | | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in CBF * for Mid, there are 2 stages: 1 in FSP and 1 in PST BF. Keyword: NSTAGE | | | |
| | type | integer | | |
| • channelization_stages | List of configuration for each channelization stage. | | | |
| | type | array | | |
| | items | Pulsar Timing specific parameters for channelization stage configuration. | | |

Table 24 – continued from previous page

| | | |
|----------------------|-------|---|
| | | <i>PST channelization stage configuration 2.5</i> |
| additionalProperties | False | |

PST RA_Dec coordinates 2.5

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.5

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode. |
| | | <i>PST spectral kurtosis configuration 2.5</i> |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.5

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode.

| | | | |
|---|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST 'DYNAMIC_SPECTRUM' mode configuration 2.5

Pulsar Timing specific parameters for the 'DYNAMIC_SPECTRUM' mode configuration.

| | | | |
|--|---|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| <ul style="list-style-type: none">rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| <ul style="list-style-type: none">output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| <ul style="list-style-type: none">num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| <ul style="list-style-type: none">time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 25 – continued from previous page

| | | |
|-------------------------|--|--|
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.5</i> |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.5

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|---|---|---|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisa- tion_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • polarizations | The polarizations to be recorded. Valid values: A, B, or Both Keyword: POLN_FT | |
| allOf | | type | <i>string</i> |
| | | enum | A, B, Both |
| • requantisa- tion_init_time | Time interval spanned by data used at the start of a scan to determine the scale factors applied before re-quantisation. Units: seconds Keyword: DIGITIZER_INIT_TIME | | |
| | type | <i>number</i> | |
| | additionalProperties | False | |

PST channelization stage configuration 2.5

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.5

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |
|----------------------|---------------|
| type | <i>object</i> |

| additionalProperties | False | | |

Common configuration schema 3.1

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$</code> |
| | default | null |
| | | |
| | | |
| additionalProperties | False | |

LOWCBF subarray configurescan 0.2

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF subsystem. This section is forwarded only to CBF subelement.

| | | | | | |
|----------------------|---|---------------------------------------|-----------------------|---------------|----------------|
| type | <i>object</i> | | | | |
| properties | | | | | |

LOW PST configure 2.5

Main configuration for the Low CSP Pulsar timing sub-system

| | | | | |
|----------------------|------------------------------------|--|-----------------------------------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • beams | List of PST Beams IDs to configure | | | |
| | type | <i>array</i> | | |
| | items | Parameters to configure the PST sub-system | | |
| | | type | <i>object</i> | |
| | | properties | | |
| | | • beam_id | Configuration for a PST beam ID | |
| | | | type | <i>integer</i> |
| | | • scan | Parameters to configure the scan | |
| | | | <i>PST scan configuration 2.5</i> | |
| | | • beam | Parameter to configure the beam | |
| | | | default | null |
| | | | <i>PST beam configuration 2.5</i> | |
| additionalProperties | False | | | |
| additionalProperties | False | | | |

PST scan configuration 2.5

Pulsar Timing specific scan configuration parameters.

| | | |
|-------------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| | default | null |
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |

continues on next page

Table 27 – continued from previous page

| | | |
|---------------------------------|---|---|
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |
| • source | The name of the source. Keyword: SRC_NAME | |
| | type | <i>string</i> |
| • itrfr | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | |
| | type | <i>array</i> |
| | items | type <i>number</i> |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | |
| | type | <i>string</i> |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | |

continues on next page

Table 27 – continued from previous page

| | | | |
|--|---|--------|-------------------|
| | allOf | type | string |
| | | enum | LIN, CIRC |
| <ul style="list-style-type: none">• feed_handedness | Code for sense of feed. For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky). For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA). For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe. Range: -1 or +1 Keyword: FD_HAND | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| <ul style="list-style-type: none">• feed_angle | Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver). Units: degrees Range: -180 to 180. Keyword: FD_SANG | | |
| | type | number | |
| <ul style="list-style-type: none">• feed_tracking_mode | The tracking mode for the feed: FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. <ul style="list-style-type: none">• CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north.• SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation.• TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. Range: FA, CPA, SPA, or TPA Keyword: FD_MODE | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| <ul style="list-style-type: none">• feed_position_angle | The requested angle of feed reference. If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallitic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'. Range: -180 to +180. Keyword: FA_REQ | | |
| | type | number | |
| <ul style="list-style-type: none">• oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Range: 8/7 or 4/3 Keyword: OVERSAMP | | |
| | type | array | |
| | items | type | integer |
| <ul style="list-style-type: none">• coordinates | The tied-array beam's tracking co-ordinates. As of version 2.2 of the schema this only handles equitorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future. <i>PST RA_Dec coordinates 2.5</i> | | |
| <ul style="list-style-type: none">• max_scan_length | The maximum length of the observation. Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX | | |
| | type | number | |
| <ul style="list-style-type: none">• subint_duration | The length of each output sub-integration. Units: seconds Range: 1 - 60 Keyword: OUTSUBINT | | |

Table 27 – continued from previous page

| | | | | |
|--------------------------------------|---|---|--------|---------|
| | type | number | | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | |
| | type | array | | |
| | items | type | string | |
| • recep- tor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | |
| | type | array | | |
| | items | type | number | |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | |
| | type | integer | | |
| | default | 0 | | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges to excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | |
| | type | array | | |
| | default | null | | |
| | items | type | array | |
| | | items | type | number |
| | • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | |
| type | | array | | |
| default | | null | | |
| items | | anyOf | type | string |
| | | | type | integer |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | |
| | type | string | | |
| | default | null | | |
| • pt | Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration. | | | |
| | default | null | | |
| • ds | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | | | |
| | default | null | | |
| | PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.5 | | | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | | | |
| | default | null | | |
| | PST ‘FLOW_THROUGH’ mode configuration 2.5 | | | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in CBF and 1 in PST * for Mid, there are 2 stages: 1 in FSP and 1 in PST BF. Keyword: NSTAGE | | | |
| | type | integer | | |
| • channeliza- tion_stages | List of configuration for each channelization stage. | | | |
| | type | array | | |
| | items | Pulsar Timing specific parameters for channelization stage configuration. | | |

| additionalProperties | False | |

PST RA_Dec coordinates 2.5

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.5

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode. |
| | | <i>PST spectral kurtosis configuration 2.5</i> |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.5

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode.

| | | | |
|---|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST 'DYNAMIC_SPECTRUM' mode configuration 2.5

Pulsar Timing specific parameters for the 'DYNAMIC_SPECTRUM' mode configuration.

| | | | |
|--------------------------------------|---|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 28 – continued from previous page

| | | |
|-------------------------|--|--|
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.5</i> |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.5

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|---|---|---------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisa- tion_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | | | |
| • polarizations | The polarizations to be recorded. Valid values: A, B, or Both Keyword: POLN_FT | | |
| | allOf | type | <i>string</i> |
| | | enum | A, B, Both |
| • requantisa- tion_init_time | Time interval spanned by data used at the start of a scan to determine the scale factors applied before re-quantisation. Units: seconds Keyword: DIGITIZER_INIT_TIME | | |
| | type | <i>number</i> | |
| | | | |
| additionalProperties | False | | |

PST channelization stage configuration 2.5

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.5

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

Example (CSP configuration for PST dynamic spectrum scan 2.4)

Low CSP specific parameters. This section contains the parameters relevant to configure the Low CSP sub-system.

| | | |
|---|---|---|
| https://schema.skao.int/ska-low-csp-configure/3.0 | | |
| type | <i>object</i> | |
| properties | | |
| • interface | URI of JSON schema for this command'sJSON payload.. | |
| | type | <i>string</i> |
| • subarray | Subarray elements | |
| | type | <i>object</i> |
| | properties | |
| | • subarray_name | Name and scope of current subarray the sub-array. |
| | type | <i>string</i> |
| | additionalProperties | False |
| • common | Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements. | |
| | Common configuration schema 3.0 | |
| • lowcbf | Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-system. This section is forwarded only to CBF subelement. | |
| | default | null |
| | LOWCBF subarray configurescan 0.2 | |
| • pss | Section with parameters to configure the PSS sub-system | |
| | default | null |
| | PSS configuration 2.0 | |
| • pst | Section with parameters to configure the PST sub-system. | |
| | default | null |
| | LOW PST configure 2.4 | |
| additionalProperties | False | |

Common configuration schema 3.0

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|---|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | <p>Execution block ID to associate scan configs to an observation.</p> <p>This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation.</p> <p>This ID does not have to be unique for a scan configuration but should be unique for different observations.</p> <p>For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field.</p> | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$</code> |
| | default | null |
| additionalProperties | False | |

LOWCBF subarray configurescan 0.2

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF subsystem. This section is forwarded only to CBF subelement.

| | | | | | |
|---------------------------|---|---------------------------------------|-----------------------|---------------|----------------|

| additionalProperties | False | | | |

PST scan configuration 2.4

Pulsar Timing specific scan configuration parameters.

| | | |
|-------------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| | default | null |
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |

continues on next page

Table 30 – continued from previous page

| | | |
|---------------------------------|---|---|
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |
| • source | The name of the source. Keyword: SRC_NAME | |
| | type | <i>string</i> |
| • itrfr | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | |
| | type | <i>array</i> |
| | items | type <i>number</i> |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | |
| | type | <i>string</i> |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | |

continues on next page

Table 30 – continued from previous page

| | | | |
|------------------------------|---|--------|-------------------|
| | allOf | type | string |
| | | enum | LIN, CIRC |
| • feed_handedness | <p>Code for sense of feed.</p> <p>For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky).</p> <p>For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA).</p> <p>For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe.</p> <p>Range: -1 or +1 Keyword: FD_HAND</p> | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| • feed_angle | <p>Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver).</p> <p>Units: degrees Range: -180 to 180. Keyword: FD_SANG</p> | | |
| | type | number | |
| • feed_tracking_mode | <p>The tracking mode for the feed:</p> <ul style="list-style-type: none"> • FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. • CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north. • SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation. • TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. <p>Range: FA, CPA, SPA, or TPA Keyword: FD_MODE</p> | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| • feed_position_angle | <p>The requested angle of feed reference.</p> <p>If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallactic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'.</p> <p>Range: -180 to +180.</p> <p>Keyword: FA_REQ</p> | | |
| | type | number | |
| • oversampling_ratio | <p>The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]).</p> <p>Range: 8/7 or 4/3 Keyword: OVERSAMP</p> | | |
| | type | array | |
| | items | type | integer |
| • coordinates | <p>The tied-array beam's tracking co-ordinates.</p> <p>As of version 2.2 of the schema this only handles equatorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future.</p> <p><i>PST RA_Dec coordinates 2.4</i></p> | | |
| • max_scan_length | <p>The maximum length of the observation.</p> <p>Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX</p> | | |
| | type | number | |
| • subint_duration | <p>The length of each output sub-integration.</p> <p>Units: seconds Range: 1 - 60 Keyword: OUTSUBINT</p> | | |

continues on next page

Table 30 – continued from previous page

| | | | | |
|------------------------------------|---|---|--------|---------|
| | type | number | | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | |
| | type | array | | |
| | items | type | string | |
| • receptor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | |
| | type | array | | |
| | items | type | number | |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | |
| | type | integer | | |
| | default | 0 | | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges to excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | |
| | type | array | | |
| | default | null | | |
| | items | type | array | |
| | | items | type | number |
| | • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | |
| type | | array | | |
| default | | null | | |
| items | | anyOf | type | string |
| | | | type | integer |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | |
| | type | string | | |
| | default | null | | |
| • pt | Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration. | | | |
| | default | null | | |
| • ds | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | | | |
| | default | null | | |
| | PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.4 | | | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | | | |
| | default | null | | |
| | PST ‘FLOW_THROUGH’ mode configuration 2.4 | | | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in CBF * for Mid, there are 2 stages: 1 in FSP and 1 in PST BF. Keyword: NSTAGE | | | |
| | type | integer | | |
| • channelization_stages | List of configuration for each channelization stage. | | | |
| | type | array | | |
| | items | Pulsar Timing specific parameters for channelization stage configuration. | | |

continues on next page

Table 30 – continued from previous page

| | | |
|----------------------|-------|---|
| | | <i>PST channelization stage configuration 2.4</i> |
| additionalProperties | False | |

PST RA_Dec coordinates 2.4

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.4

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode. |
| | | <i>PST spectral kurtosis configuration 2.4</i> |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.4

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode.

| | | | |
|---|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST 'DYNAMIC_SPECTRUM' mode configuration 2.4

Pulsar Timing specific parameters for the 'DYNAMIC_SPECTRUM' mode configuration.

| | | | |
|--------------------------------------|---|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 31 – continued from previous page

| | | |
|-------------------------|--|--|
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.4</i> |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.4

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|--------------------------------|---|--|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisation_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • num_channels | The number of input channels to be recorded. This value must be less than or equal to the output_frequency_channels. Keyword: NCHAN_FT | |
| type | | <i>integer</i> | |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | | |
| | type | <i>number</i> | |
| | additionalProperties | False | |

PST channelization stage configuration 2.4

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---------------------------------|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| • filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| • num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| • oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.4

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |
|----------------------|---------------|
| type | <i>object</i> |
| properties | |
| additionalProperties | False |

Low CSP specific parameters. This section contains the parameters relevant to configure the Low CSP sub-system.

| | | |
|---|---|---|
| https://schema.skao.int/ska-low-csp-configure/2.0 | | |
| type | <i>object</i> | |
| properties | | |
| • interface | URI of JSON schema for this command's JSON payload.. | |
| | type | <i>string</i> |
| • subarray | Subarray elements | |
| | type | <i>object</i> |
| | properties | |
| | • subarray_name | Name and scope of current subarray the sub-array. |
| | | type <i>string</i> |
| | additionalProperties | False |
| • common | Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements. | |
| | Common configuration schema 2.0 | |
| • lowcbf | Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-system. This section is forwarded only to CBF subelement. | |
| | default | null |
| | LOWCBF subarray configurescan 0.1 | |
| • pss | Section with parameters to configure the PSS sub-system | |
| | default | null |
| | PSS configuration 2.0 | |
| • pst | Section with parameters to configure the PST sub-system. | |
| | default | null |
| | LOW PST configure 2.4 | |
| additionalProperties | False | |

Common configuration schema 2.0

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|---|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | <p>Execution block ID to associate scan configs to an observation.</p> <p>This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation.</p> <p>This ID does not have to be unique for a scan configuration but should be unique for different observations.</p> <p>For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field.</p> | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$</code> |
| | default | null |
| additionalProperties | False | |

LOWCBF subarray configurescan 0.1

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF subsystem. This section is forwarded only to CBF subelement.

LOW PST configure 2.4

Main configuration for the Low CSP Pulsar timing sub-system

| | | | | |
|----------------------|------------------------------------|--|-----------------------------------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • beams | List of PST Beams IDs to configure | | | |
| | type | <i>array</i> | | |
| | items | Parameters to configure the PST sub-system | | |
| | | type | <i>object</i> | |
| | | properties | | |
| | | • beam_id | Configuration for a PST beam ID | |
| | | | type | <i>integer</i> |
| | | • scan | Parameters to configure the scan | |
| | | | <i>PST scan configuration 2.4</i> | |
| | | • beam | Parameter to configure the beam | |
| | | | default | null |
| | | | <i>PST beam configuration 2.4</i> | |
| additionalProperties | False | | | |
| additionalProperties | False | | | |

PST scan configuration 2.4

Pulsar Timing specific scan configuration parameters.

| | | |
|-------------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| | default | null |
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |

continues on next page

Table 34 – continued from previous page

| | | |
|---------------------------------|---|---|
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |
| • source | The name of the source. Keyword: SRC_NAME | |
| | type | <i>string</i> |
| • itrfr | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | |
| | type | <i>array</i> |
| | items | type <i>number</i> |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | |
| | type | <i>string</i> |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | |

continues on next page

Table 34 – continued from previous page

| | | | |
|--|---|--------|-------------------|
| | allOf | type | string |
| | | enum | LIN, CIRC |
| <ul style="list-style-type: none">• feed_handedness | Code for sense of feed. For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky). For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA). For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe. Range: -1 or +1 Keyword: FD_HAND | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| <ul style="list-style-type: none">• feed_angle | Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver). Units: degrees Range: -180 to 180. Keyword: FD_SANG | | |
| | type | number | |
| <ul style="list-style-type: none">• feed_tracking_mode | The tracking mode for the feed: FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. <ul style="list-style-type: none">• CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north.• SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation.• TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. Range: FA, CPA, SPA, or TPA Keyword: FD_MODE | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| <ul style="list-style-type: none">• feed_position_angle | The requested angle of feed reference. If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallitic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'. Range: -180 to +180. Keyword: FA_REQ | | |
| | type | number | |
| <ul style="list-style-type: none">• oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Range: 8/7 or 4/3 Keyword: OVERSAMP | | |
| | type | array | |
| | items | type | integer |
| <ul style="list-style-type: none">• coordinates | The tied-array beam's tracking co-ordinates. As of version 2.2 of the schema this only handles equitorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future. <i>PST RA_Dec coordinates 2.4</i> | | |
| <ul style="list-style-type: none">• max_scan_length | The maximum length of the observation. Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX | | |
| | type | number | |
| <ul style="list-style-type: none">• subint_duration | The length of each output sub-integration. Units: seconds Range: 1 - 60 Keyword: OUTSUBINT | | |

continues on next page

Table 34 – continued from previous page

| | | | | |
|--------------------------------------|---|---|--------|---------|
| | type | number | | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | |
| | type | array | | |
| | items | type | string | |
| • recep- tor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | |
| | type | array | | |
| | items | type | number | |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | |
| | type | integer | | |
| | default | 0 | | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges to excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | |
| | type | array | | |
| | default | null | | |
| | items | type | array | |
| | | items | type | number |
| | • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | |
| type | | array | | |
| default | | null | | |
| items | | anyOf | type | string |
| | | | type | integer |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | |
| | type | string | | |
| | default | null | | |
| • pt | Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration. | | | |
| | default | null | | |
| | PST ‘PULSAR_TIMING’ mode configuration 2.4 | | | |
| • ds | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | | | |
| | default | null | | |
| | PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.4 | | | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | | | |
| | default | null | | |
| | PST ‘FLOW_THROUGH’ mode configuration 2.4 | | | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in CBF and 1 in PST * for Mid, there are 2 stages: 1 in FSP and 1 in PST BF. Keyword: NSTAGE | | | |
| | type | integer | | |
| • channeliza- tion_stages | List of configuration for each channelization stage. | | | |
| | type | array | | |
| | items | Pulsar Timing specific parameters for channelization stage configuration. | | |

Table 34 – continued from previous page

| | | |
|----------------------|-------|---|
| | | <i>PST channelization stage configuration 2.4</i> |
| additionalProperties | False | |

PST RA_Dec coordinates 2.4

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.4

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode. |
| | | <i>PST spectral kurtosis configuration 2.4</i> |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.4

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode.

| | | | |
|---|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST 'DYNAMIC_SPECTRUM' mode configuration 2.4

Pulsar Timing specific parameters for the 'DYNAMIC_SPECTRUM' mode configuration.

| | | | |
|--------------------------------------|---|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 35 – continued from previous page

| | | |
|-------------------------|--|--|
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.4</i> |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.4

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|--------------------------------------|---|--|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisa- tion_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • num_channels | The number of input channels to be recorded. This value must be less than or equal to the output_frequency_channels. Keyword: NCHAN_FT | |
| type | | <i>integer</i> | |
| • requantisa- tion_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST channelization stage configuration 2.4

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---------------------------------|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| • filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| • num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| • oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.4

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |
|----------------------|---------------|
| type | <i>object</i> |

Schema to validate the Pulsar Timing configuration.

| | | |
|---|--|---|
| https://schema.skao.int/ska-pst-configure/2.5 | | |
| type | <i>object</i> | |
| properties | | |
| • pst | Pulsar Timing specific parameters. To be borrowed from IICD | |
| | type | <i>object</i> |
| | properties | |
| | • scan | Pulsar Timing specific scan configuration parameters. |
| | | default null |
| | | PST scan configuration 2.5 |
| | • beam | Pulsar Timing specific beam configuration parameters. As of version 2.3 this schema has no elements and is deprecated |
| | | default null |
| | | PST beam configuration 2.5 |
| | additionalProperties | False |
| • interface | URI of JSON schema for this command's JSON payload.. | |
| | type | <i>string</i> |
| • common | Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements. | |
| | Common configuration schema 2.5 | |
| additionalProperties | False | |

PST scan configuration 2.5

Pulsar Timing specific scan configuration parameters.

| | | |
|-------------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |

continues on next page

Table 36 – continued from previous page

| | | |
|---------------------------------|---|---|
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |
| • source | The name of the source. Keyword: SRC_NAME | |
| | type | <i>string</i> |
| • itrfr | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | |
| | type | <i>array</i> |
| | items | type <i>number</i> |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | |
| | type | <i>string</i> |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | |

continues on next page

Table 36 – continued from previous page

| | | | |
|---|---|--------|-------------------|
| | allOf | type | string |
| | | enum | LIN, CIRC |
| <ul style="list-style-type: none">• feed_handedness | Code for sense of feed. For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky). For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA). For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe. Range: -1 or +1 Keyword: FD_HAND | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| <ul style="list-style-type: none">• feed_angle | Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver). Units: degrees Range: -180 to 180. Keyword: FD_SANG | | |
| | type | number | |
| <ul style="list-style-type: none">• feed_tracking_mode | The tracking mode for the feed: • FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. • CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north. • SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation. • TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. Range: FA, CPA, SPA, or TPA Keyword: FD_MODE | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| <ul style="list-style-type: none">• feed_position_angle | The requested angle of feed reference. If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (paralltic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'. Range: -180 to +180. Keyword: FA_REQ | | |
| | type | number | |
| <ul style="list-style-type: none">• oversam- pling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Range: 8/7 or 4/3 Keyword: OVERSAMP | | |
| | type | array | |
| | items | type | integer |
| <ul style="list-style-type: none">• coordinates | The tied-array beam's tracking co-ordinates. As of version 2.2 of the schema this only handles equitorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future. PST RA_Dec coordinates 2.5 | | |
| <ul style="list-style-type: none">• max_scan_length | The maximum length of the observation. Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX | | |
| | type | number | |
| <ul style="list-style-type: none">• subint_duration | The length of each output sub-integration. Units: seconds Range: 1 - 60 Keyword: OUTSUBINT | | |

|--------------------------------------|---|---|--------|---------|
| | type | number | | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | |
| | type | array | | |
| | items | type | string | |
| • recep- tor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | |
| | type | array | | |
| | items | type | number | |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | |
| | type | integer | | |
| | default | 0 | | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges to excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | |
| | type | array | | |
| | default | null | | |
| | items | type | array | |
| | | items | type | number |
| | • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | |
| type | | array | | |
| default | | null | | |
| items | | anyOf | type | string |
| | | | type | integer |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | |
| | type | string | | |
| | default | null | | |
| • pt | Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration. | | | |
| | default | null | | |
| • ds | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | | | |
| | default | null | | |
| | PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.5 | | | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | | | |
| | default | null | | |
| | PST ‘FLOW_THROUGH’ mode configuration 2.5 | | | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in CBF and 1 in PST * for Mid, there are 2 stages: 1 in FSP and 1 in PST BF. Keyword: NSTAGE | | | |
| | type | integer | | |
| • channeliza- tion_stages | List of configuration for each channelization stage. | | | |
| | type | array | | |
| | items | Pulsar Timing specific parameters for channelization stage configuration. | | |

Table 36 – continued from previous page

| | | |
|----------------------|-------|---|
| | | <i>PST channelization stage configuration 2.5</i> |
| additionalProperties | False | |

PST RA_Dec coordinates 2.5

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.5

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode. |
| | | <i>PST spectral kurtosis configuration 2.5</i> |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.5

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode.

| | | | |
|---|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST 'DYNAMIC_SPECTRUM' mode configuration 2.5

Pulsar Timing specific parameters for the 'DYNAMIC_SPECTRUM' mode configuration.

| | | | |
|--------------------------------------|---|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 37 – continued from previous page

| | | |
|-------------------------|--|--|
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.5</i> |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.5

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|---|---|---|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisa- tion_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • polarizations | The polarizations to be recorded. Valid values: A, B, or Both Keyword: POLN_FT | |
| allOf | | type | <i>string</i> |
| | | enum | A, B, Both |
| • requantisa- tion_init_time | Time interval spanned by data used at the start of a scan to determine the scale factors applied before re-quantisation. Units: seconds Keyword: DIGITIZER_INIT_TIME | | |
| | type | <i>number</i> | |
| | additionalProperties | False | |

PST channelization stage configuration 2.5

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.5

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |
|----------------------|---------------|
| type | <i>object</i> |
| properties | |
| additionalProperties | False |

Common configuration schema 2.5

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|---|--|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | <p>Execution block ID to associate scan configs to an observation.</p> <p>This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation.</p> <p>This ID does not have to be unique for a scan configuration but should be unique for different observations.</p> <p>For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field.</p> | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\\$</code> |
| | default | null |
| • frequency_band | <p>Frequency band applies for all the receptors (VCCs) that belong to the subarray.</p> <p>The value of 'low' is used to only within SKA Low. As this field is a mandatory field but bands 1, 2, 3, 4, 5a and 5b only make sense for SKA Mid.</p> | |
| | type | <i>string</i> |
| | pattern | <code>^(1 2 3 4 5(a b) low)\\$</code> |
| additionalProperties | False | |

Schema to validate the Pulsar Timing configuration.

| | | |
|---|--|---|
| https://schema.skao.int/ska-pst-configure/2.4 | | |
| type | <i>object</i> | |
| properties | | |
| • pst | Pulsar Timing specific parameters. To be borrowed from IICD | |
| | type | <i>object</i> |
| | properties | |
| | • scan | Pulsar Timing specific scan configuration parameters. |
| | | default null |
| | | PST scan configuration 2.4 |
| | • beam | Pulsar Timing specific beam configuration parameters. As of version 2.3 this schema has no elements and is deprecated |
| | | default null |
| | | PST beam configuration 2.4 |
| | additionalProperties | False |
| • interface | URI of JSON schema for this command's JSON payload.. | |
| | type | <i>string</i> |
| • common | Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements. | |
| | Common configuration schema 2.4 | |
| additionalProperties | False | |

PST scan configuration 2.4

Pulsar Timing specific scan configuration parameters.

| | | |
|-------------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |

continues on next page

Table 38 – continued from previous page

| | | |
|---------------------------------|---|---|
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |
| • source | The name of the source. Keyword: SRC_NAME | |
| | type | <i>string</i> |
| • itrfr | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | |
| | type | <i>array</i> |
| | items | type <i>number</i> |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | |
| | type | <i>string</i> |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | |

continues on next page

Table 38 – continued from previous page

| | | | |
|--|---|--------|-------------------|
| | allOf | type | string |
| | | enum | LIN, CIRC |
| <ul style="list-style-type: none">• feed_handedness | Code for sense of feed. For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky). For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA). For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe. Range: -1 or +1 Keyword: FD_HAND | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| <ul style="list-style-type: none">• feed_angle | Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focus receiver). Units: degrees Range: -180 to 180. Keyword: FD_SANG | | |
| | type | number | |
| <ul style="list-style-type: none">• feed_tracking_mode | The tracking mode for the feed: FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. <ul style="list-style-type: none">• CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the coordinate mode is GALACTIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north.• SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation.• TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. Range: FA, CPA, SPA, or TPA Keyword: FD_MODE | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| <ul style="list-style-type: none">• feed_position_angle | The requested angle of feed reference. If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallactic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'. Range: -180 to +180. Keyword: FA_REQ | | |
| | type | number | |
| <ul style="list-style-type: none">• oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Range: 8/7 or 4/3 Keyword: OVERSAMP | | |
| | type | array | |
| | items | type | integer |
| <ul style="list-style-type: none">• coordinates | The tied-array beam's tracking co-ordinates. As of version 2.2 of the schema this only handles equatorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future. <i>PST RA_Dec coordinates 2.4</i> | | |
| <ul style="list-style-type: none">• max_scan_length | The maximum length of the observation. Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX | | |
| | type | number | |
| <ul style="list-style-type: none">• subint_duration | The length of each output sub-integration. Units: seconds Range: 1 - 60 Keyword: OUTSUBINT | | |

continues on next page

Table 38 – continued from previous page

| | | | | |
|--------------------------------------|---|---|--------|---------|
| | type | number | | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | |
| | type | array | | |
| | items | type | string | |
| • recep- tor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | |
| | type | array | | |
| | items | type | number | |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | |
| | type | integer | | |
| | default | 0 | | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges to excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | |
| | type | array | | |
| | default | null | | |
| | items | type | array | |
| | | items | type | number |
| | • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | |
| type | | array | | |
| default | | null | | |
| items | | anyOf | type | string |
| | | | type | integer |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | |
| | type | string | | |
| | default | null | | |
| • pt | Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration. | | | |
| | default | null | | |
| | PST ‘PULSAR_TIMING’ mode configuration 2.4 | | | |
| • ds | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | | | |
| | default | null | | |
| | PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.4 | | | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | | | |
| | default | null | | |
| | PST ‘FLOW_THROUGH’ mode configuration 2.4 | | | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in CBF and 1 in PST * for Mid, there are 2 stages: 1 in FSP and 1 in PST BF. Keyword: NSTAGE | | | |
| | type | integer | | |
| • channeliza- tion_stages | List of configuration for each channelization stage. | | | |
| | type | array | | |
| | items | Pulsar Timing specific parameters for channelization stage configuration. | | |

continues on next page

Table 38 – continued from previous page

| | | |
|----------------------|-------|---|
| | | <i>PST channelization stage configuration 2.4</i> |
| additionalProperties | False | |

PST RA_Dec coordinates 2.4

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.4

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.4</i> |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.4

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode.

| | | | |
|---|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST 'DYNAMIC_SPECTRUM' mode configuration 2.4

Pulsar Timing specific parameters for the 'DYNAMIC_SPECTRUM' mode configuration.

| | | | |
|--------------------------------------|---|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 39 – continued from previous page

| | | |
|-------------------------|--|--|
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.4</i> |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.4

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|--------------------------------|---|--|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisation_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • num_channels | The number of input channels to be recorded. This value must be less than or equal to the output_frequency_channels. Keyword: NCHAN_FT | |
| type | | <i>integer</i> | |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST channelization stage configuration 2.4

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.4

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |
|----------------------|---------------|
| type | <i>object</i> |
| properties | |
| additionalProperties | False |

Common configuration schema 2.4

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$</code> |
| | default | null |
| • frequency_band | Frequency band applies for all the receptors (VCCs) that belong to the subarray. The value of 'low' is used to only within SKA Low. As this field is a mandatory field but bands 1, 2, 3, 4, 5a and 5b only make sense for SKA Mid. | |
| | type | <i>string</i> |
| | pattern | <code>^(1 2 3 4 5(a b) low)\$</code> |
| additionalProperties | False | |

1.13 Low CBF schemas

Schemas used for commands to Low.CBF subarrays

1.13.1 ska-low-cbf-assignresources

LOWCBF assign resources 0.1

Example JSON

```
{
  "interface": "https://schema.skao.int/ska-low-cbf-assignresources/0.0",
  "lowcbf": {
    "resources": [{
      "device": "fsp_01",
      "shared": true,
      "fw_image": "pst",
      "fw_mode": "unused"
    }, {
      "device": "p4_01",
      "shared": true,
      "fw_image": "p4.bin",
```

(continues on next page)

(continued from previous page)

```

    "fw_mode": "p4"
  }
}

```

| | | |
|---|---|-----------------------------------|
| https://schema.skao.int/ska-low-cbf-assignresources/0.1 | | |
| type | <i>object</i> | |
| properties | | |
| • interface | URI of JSON schema for this command's JSON payload. | |
| | type | <i>string</i> |
| • lowcbf | LOWCBF assign resources | |
| | type | <i>object</i> |
| | properties | |
| | • resources | array of LOWCBF resources |
| | | type <i>array</i> |
| | | items <i>LOWCBF resources 0.1</i> |
| | additionalProperties | False |
| additionalProperties | False | |

LOWCBF resources 0.1

| | | |
|----------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • device | Name of FSP or P4 device | |
| | type | <i>string</i> |
| • shared | Whether device is shared with other subarrays | |
| | type | <i>boolean</i> |
| • fw_image | Name of firmware image to load on device | |
| | type | <i>string</i> |
| | default | null |
| • fw_mode | Mode in which firmware runs | |
| | type | <i>string</i> |
| | default | null |
| additionalProperties | False | |

1.13.2 ska-low-cbf-configurescan

LOWCBF configurescan 1.0

Example (Low CBF Configuration JSON including Nakshatra work)

```

{
  "interface": "https://schema.skao.int/ska-low-cbf-configurescan/1.0",
  "lowcbf": {
    "stations": {
      "stns": [
        [1, 1],

```

(continues on next page)

(continued from previous page)

```

1.14 Low MCCS schemas

1.14.1 ska-low-mccs-assignedresources

Low MCCS assigned resources 1.0

Example JSON.

```
{
  "interface": "https://schema.skatelescope.org/ska-low-mccs-assignedresources/1.0",
  "subarray_beam_ids": [1],
  "station_ids": [
    [1, 2]
  ],
  "channel_blocks": [3]
}
```

| | | | | |
|---|--|--|---------|---------|
| https://schema.skatelescope.org/ska-low-mccs-assignedresources/1.0 | | | | |
| type | | object | | |
| properties | | | | |
| • interface | URI of JSON schema applicable to this JSON payload. | | | |
| | type | string | | |
| • subarray_beam_ids | IDs of the MCCS sub-array beams allocated to this MCCS subarray. Each ID must be between 1 and 48, the maximum number of MCCS sub-array beams. As of PI10, only one MCCS sub-array beam can be configured per allocation request. Multiple beams must be allocated via multiple allocation requests. | | | |
| | type | array | | |
| | items | type | integer | |
| | • station_ids | IDs of MCCS stations allocated to each sub-array beam. Each ID must be between 1 and 512, the maximum number of stations. | | |
| type | | array | | |
| items | | type | array | |
| | | items | type | integer |
| • channel_blocks | Number of channel blocks allocated to each sub-array beam. Maximum number of channel blocks = 48. | | | |
| | type | array | | |
| | items | type | integer | |
| additionalProperties | False | | | |

1.14.2 ska-low-mccs-assignresources

Low MCCS assign resources 1.0

Example JSON.

```
{
  "interface": "https://schema.skatelescope.org/ska-low-mccs-assignresources/1.0",
  "subarray_id": 1,
  "subarray_beam_ids": [1],
  "station_ids": [
```

(continues on next page)

```

    [1, 2]
  ],
  "channel_blocks": [3]
}

```

| | | | |
|--|---|---------|---------|
| https://schema.skatelescope.org/ska-low-mccs-assignresources/1.0 | | | |
| type | object | | |
| properties | | | |
| • interface | URI of JSON schema applicable to this JSON payload. | | |
| | type | string | |
| • subarray_id | ID of sub-array targeted by this resource allocation request | | |
| | type | integer | |
| • subarray_beam_ids | IDs of the MCCS sub-array beams to allocate to this MCCS subarray. Each ID must be between 1 and 48, the maximum number of sub-array beams. As of PI10, only one MCCS sub-array beam can be configured per allocation request. Multiple beams must be allocated via multiple allocation requests. | | |
| | type | array | |
| | items | type | integer |
| | | | |
| • station_ids | IDs of MCCS stations to allocate to this sub-array beam. Each ID must be between 1 and 512, the maximum number of stations. | | |
| | type | array | |
| | items | type | array |
| | | items | type |
| • channel_blocks | Number of channel blocks to allocate to this sub-array beam. Maximum number of channel blocks = 48. | | |
| | type | array | |
| | items | type | integer |
| additionalProperties | False | | |

1.14.3 ska-low-mccs-releaseresources

Low MCCS resource release 1.0

Example JSON.

```

{
  "interface": "https://schema.skatelescope.org/ska-low-mccs-releaseresources/1.0",
  "subarray_id": 1,
  "release_all": true
}

```

| | | |
|---|---|---------|
| https://schema.skatelescope.org/ska-low-mccs-releaseresources/1.0 | | |
| type | object | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | string |
| • subarray_id | ID of the MCCS sub-array which should release resources. | |
| | type | integer |
| • release_all | true to release all resources, false to release only the resources defined in this payload. Note: partial resource release for MCCS is not implemented and the identification of the resources to release is not yet part of the schema. | |
| | type | boolean |
| additionalProperties | False | |

1.14.4 ska-low-mccs-configure

Low MCCS configure 1.0

Example JSON.

```
{
  "interface": "https://schema.skatelescope.org/ska-low-mccs-configure/1.0",
  "stations": [{
    "station_id": 1
  }, {
    "station_id": 2
  }],
  "subarray_beams": [{
    "subarray_beam_id": 1,
    "station_ids": [1, 2],
    "update_rate": 0.0,
    "channels": [
      [0, 8, 1, 1],
      [8, 8, 2, 1],
      [24, 16, 2, 1]
    ],
    "sky_coordinates": [0.0, 180.0, 0.0, 45.0, 0.0],
    "antenna_weights": [1.0, 1.0, 1.0],
    "phase_centre": [0.0, 0.0]
  }],
}
```

| | | |
|---|--|---------------|
| https://schema.skatelescope.org/ska-low-mccs-configure/1.0 | | |
| type | <i>object</i> | |
| properties | | |
| • inter- face | URI of JSON schema applicable to this JSON payload. | |
| | type | <i>string</i> |
| • sta- tions | IDs of the MCCS stations to configure. Maximum array size = 512, the maximum number of MCCS stations. | |
| | type | <i>array</i> |

continues on next page

Table 46 – continued from previous page

| | | | | | | |
|-------------------------|------------------------------------|---|---|----------------|----------------|----------------|
| | items | type | | <i>object</i> | | |
| | | properties | | | | |
| | | <ul style="list-style-type: none">• station_id | type | <i>integer</i> | | |
| | | additional-Properties | True | | | |
| • subarray_beams | MCCS sub-array beam configuration. | | | | | |
| | type | <i>array</i> | | | | |
| | items | type | | <i>object</i> | | |
| | | properties | | | | |
| | | • subarray_beam_id | ID of MCCS sub-array beam to configure. ID must be an integer between 1 and 48. | | | |
| | | | type | <i>integer</i> | | |
| | | • station_ids | IDs of MCCS stations within this sub-array beam to configure. Array size must be less than 512, the maximum number of MCCS stations. Each item in the list must be an integer between 1 and 512. | | | |
| | | | type | <i>array</i> | | |
| | | | items | type | <i>integer</i> | |
| | | • update_rate | Update rate for pointing information. Value must be 0.0 or greater. TODO: clarify whether this is specified as a frequency or as a cadence, plus units. | | | |
| | | | type | <i>number</i> | | |
| | | • channels | Channel block configurations. Each item in the list is a channel block configuration, each specified as a list of 4 numbers as follows: [start channel, number of channels, beam index, sub-station index] Constraints are: 0 < start channel < 376 start channel must be a multiple of 8 8 < number of channels < 48 1 < beam index < 48 1 < sub-station index < 8 | | | |
| | | | type | <i>array</i> | | |
| | | | items | type | <i>array</i> | |
| | | | | items | type | <i>integer</i> |
| | | • antenna_weights | Antenna weights. Maximum array size = 512 (=256 antennas x2 pols per sub-array beam). Antennas signals can be weighted to modify the station beam, varying from 0.0 for full exclusion to potentially 256.0 for an antenna contribution compensated for the number of antennas in the beam. This value is an amplitude multiplier added to that antenna signal before adding into the sum. Weights apply to all channels assigned to a beam. | | | |
| | | | type | <i>array</i> | | |
| | | | items | type | <i>number</i> | |

continues on next page

Table 46 – continued from previous page

| | | | | | |
|--|--|--------------------------|--|-------|--------|
| | | • phase_centre | Phase centre offset for the station beam, in metres. The reference position for station phase must be modified to reflect antenna weighting and their contribution to the station beam. This offset can be considered the desired centre of mass for the station. Constraints: array size = 2 -20 < phase centre value < 20 | | |
| | | | type | array | |
| | | | items | type | number |
| | | • sky_coordinates | Azimuth/elevation of sub-array beam target, in degrees. | | |
| | | | type | array | |
| | | | items | type | number |
| | | additional-Properties | False | | |
| | | additional-Properties | False | | |

1.14.5 ska-low-mccs-scan

Low MCCS scan 1.0

Example JSON.

```
{
  "interface": "https://schema.skatelescope.org/ska-low-mccs-scan/1.0",
  "scan_id": 1,
  "start_time": 0.0
}
```

| | | |
|---|---|---------|
| https://schema.skatelescope.org/ska-low-mccs-scan/1.0 | | |
| type | object | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | string |
| • scan_id | Scan ID to associate with the data. The scan ID and SBI ID are used together to uniquely associate the data taken with the telescope configuration in effect at the moment of observation. | |
| | type | integer |
| • start_time | Start time for the scan. Currently unused and can be set to 0.0. | |
| | type | number |
| additionalProperties | False | |

1.14.6 ska-low-mccs-antenna-config

1.15 Mid CBF schemas

Schemas used for commands to the CSP Mid.CBF.

See [Mid.CBF Controller and Subarray command documentation](#) for documentation of all commands.

1.15.1 ska-mid-cbf-initsysparam

MID.CBF Parameters 1.0

Example (MID.CBF Parameters)

```
{
  "interface": "https://schema.skao.int/ska-midcbf-initsysparam/1.0",
  "dish_parameters": {
    "SKA001": {
      "vcc": 1,
      "k": 11
    },
    "SKA100": {
      "vcc": 2,
      "k": 101
    },
    "SKA036": {
      "vcc": 3,
      "k": 1127
    },
    "SKA063": {
      "vcc": 4,
      "k": 620
    }
  }
}
```

Example (MID.CBF Parameters Source URI)

```
{
  "interface": "https://schema.skao.int/ska-mid-cbf-initsysparam/1.0",
  "tm_data_sources": ["car://gitlab.com/ska-telescope/ska-telmodel-data?1.0.0#tmdata"],
  "tm_data_filepath": "instrument/ska1_mid_psi/ska-mid-cbf-system-parameters.json"
}
```

| | |
|---|--|
| https://schema.skao.int/ska-mid-cbf-initsysparam/1.0 | |
| anyOf | <i>mid-cbf parameters 1.0</i> |
| | <i>mid-cbf parameters source URI 1.0</i> |

mid-cbf parameters 1.0

| | | |
|--------------------------|--|---------------|
| type | <i>object</i> | |
| properties | | |
| • interface | URI of JSON schema for this command's JSON payload. | |
| | type | <i>string</i> |
| • dish_parameters | Dish parameters section containing the information needed to map each dish ID to its initialization parameters, including the vcc ID and offset-index k value. | |
| | <i>dish mapping 1.0</i> | |
| additionalProperties | False | |

dish mapping 1.0

| | | |
|----------------------|---|--|
| type | <i>object</i> | |
| properties | | |
| • dish ID | At least one dish ID must be specified, and each dish ID must be a valid ID. Valid dish IDs include: SKA dishes: "SKAnnn", where nnn is a zero padded integer in the range of 001 to 133. MeerKAT dishes: "MKTnnn", where nnn is a zero padded integer in the range of 000 to 063. | |
| | <i>dish mapping details 1.0</i> | |
| additionalProperties | False | |

dish mapping details 1.0

| | | |
|----------------------|--|----------------|
| type | <i>object</i> | |
| properties | | |
| • vcc | The VCC ID for the given dish ID. Range: [1-197] | |
| | type | <i>integer</i> |
| • k | The offset-index k value for the dish ID. Range: [1-2222] | |
| | type | <i>integer</i> |
| additionalProperties | False | |

mid-cbf parameters source URI 1.0

| | | | |
|---------------------------|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • interface | URI of JSON schema for this command’s JSON payload. | | |
| | type | <i>string</i> | |
| • tm_data_sources | The telmodel data source. This parameter must be provided as a list containing a single entry. | | |
| | type | <i>array</i> | |
| | items | type | <i>string</i> |
| • tm_data_filepath | Path to the JSON file containing the dish parameters required to execute the Mid CBF InitSysParam command. | | |
| | type | <i>string</i> | |
| | pattern | ^\\S+\\.json\$ | |
| additionalProperties | False | | |

1.16 Science Data Processor schemas

Schemas used for commands to / attributes from the SDP LMC. See [SDP LMC subarray documentation](#) for an overview of the interactions.

1.16.1 ska-sdp-assignres

SDP assign resources 0.4

Example

```
{
  "execution_block": {

```

Used for assigning resources to an SDP subarray.

As concrete resource usage for the SDP depend strongly on the underlying processing script, this fully parameterises all processing blocks to be executed. This especially means that in contrast to most other sub-systems, SDP processing deployments might persist across scans (and scan configuration) boundaries.

Processing block 0.4

A Processing Block is an atomic unit of data processing for the purpose of SDP's internal scheduler. Each PB references a processing script and together with the associated execution block provides all parameters necessary to carry out scheduling - both on TM's side for observation planning and on SDP's side - as well as enable processing to locate all required inputs once it is in progress.

PBs are used for both real-time and deferred, batch, processing. An execution block will often contain many Processing Blocks, for example for ingest, self-calibration and Data Product preparation.

| | | |
|-----------------|--|--------------------------------------|
| type | <i>object</i> | |
| properties | | |
| • pb_id | Unique identifier for this processing block. | |
| | type | <i>string</i> |
| | pattern | ^pb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ |
| • script | Specification of the workflow to be executed along with configuration parameters for the workflow. | |
| | type | <i>object</i> |
| | properties | |

Table 50 – continued from previous page

| | | | | | | |
|---------------------------|--|---|---|--|--|--|
| | • kind | The kind of processing script (realtime or batch) | | | | |
| | | allOf | type | <i>string</i> | | |
| | | | enum | realtime, batch | | |
| | • name | The name of the processing script | | | | |
| | | type | <i>string</i> | | | |
| | • version | Version of the processing script. Uses semantic versioning. | | | | |
| type | | <i>string</i> | | | | |
| additionalProp- erties | False | | | | | |
| • param- eters | Configuration parameters needed to execute the workflow. As these parameters will be workflow specific, this is left as an object to be specified by the workflow definition. | | | | | |
| | type | <i>object</i> | | | | |
| | default | null | | | | |
| • depen- dencies | A dependency between processing blocks means that one processing block requires something from the other processing block to run - typically an intermediate Data Product. This generally means that | | | | | |
| | 1. The dependent processing block might only be able to start once the dependency has been fulfilled | | | | | |
| | 2. Data associated with the dependency must be kept alive until the dependent processing block is finished. | | | | | |
| | As processing blocks might have many different outputs, the dependency “kind” can be used to specify how this dependency is meant to be interpreted (e.g. “visibilities”, “calibration”...) | | | | | |
| | type | <i>array</i> | | | | |
| | default | null | | | | |
| | items | type | <i>object</i> | | | |

```

Used for assigning resources to an SDP subarray.

As concrete resource usage for the SDP depend strongly on the underlying processing script, this fully parameterises all processing blocks to be executed. This especially means that in contrast to most other sub-systems, SDP processing deployments might persist across scans (and scan configuration) boundaries.

| | | |
|---|---|--|
| https://schema.skao.int/ska-sdp-assignres/0.3 | | |
| type | object | |
| properties | | |
| • interface | type | string |
| | default | null |
| • transaction_id | type | string |
| | pattern | ^txn\[a-z0-9]+\-[0-9]{8}\[a-z0-9]+\$ |
| | default | null |
| • eb_id | Execution block ID to associate with processing | |
| | type | string |
| | pattern | ^eb\[a-z0-9]+\-[0-9]{8}\[a-z0-9]+\$ |
| • max_length | Hint about the maximum observation length to support by the SDP. Used for ensuring that enough buffer capacity is available to capture measurements. Resources assignment might fail if we do not have enough space to guarantee that all data could be captured. | |
| | type | number |
| | default | null |
| • scan_types | Scan types to be supported on subarray | |
| | type | array |
| | items | A scan configuration for SDP. Once AssignResources has been performed successfully, subsequent Configure commands can select from these scan types in order to coordinate SDP with other sub-systems participating in the observation - for instance to switch between targets, or perform special calibration scans. |
| | | Scan type 0.3 |
| • processing_blocks | type | array |
| | items | A Processing Block is an atomic unit of data processing for the purpose of SDP's internal scheduler. Each PB references a processing script and together with the associated execution block provides all parameters necessary to carry out scheduling - both on TM's side for observation planning and on SDP's side - as well as enable processing to locate all required inputs once it is in progress. PBs are used for both real-time and deferred, batch, processing. An execution block will often contain many Processing Blocks, for example for ingest, self-calibration and Data Product preparation. |
| | | Processing block 0.3 |
| | | |
| additionalProperties | False | |

Scan type 0.3

A scan configuration for SDP. Once AssignResources has been performed successfully, subsequent Configure commands can select from these scan types in order to coordinate SDP with other sub-systems participating in the observation - for instance to switch between targets, or perform special calibration scans.

| | | | |
|----------------------|---|--|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • scan_type_id | const | (any scan type) | |
| • reference_frame | Specification of the reference frame or system for a set of pointing coordinates (see ADR-49) | | |
| | default | null | |
| | allOf | type | <i>string</i> |
| | | const | ICRS |
| • ra | Right Ascension in degrees (see ADR-49) | | |
| | type | <i>string</i> | |
| | default | null | |
| • dec | Declination in degrees (see ADR-49) | | |
| | type | <i>string</i> | |
| | default | null | |
| • channels | type | <i>array</i> | |
| | default | null | |
| | items | Informs SDP ingest about the expected channel configuration, especially which frequencies are expected to be mapped to which channel ID. Note that channel IDs are not guaranteed to be continuous, so this might involve gaps and/or strides. | |
| | | <i>Scan channels 0.3</i> | |
| additionalProperties | False | | |

Scan channels 0.3

Informs SDP ingest about the expected channel configuration, especially which frequencies are expected to be mapped to which channel ID. Note that channel IDs are not guaranteed to be continuous, so this might involve gaps and/or strides.

| | | |
|----------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • count | Number of channels | |
| | type | <i>integer</i> |
| • start | First channel ID | |
| | type | <i>integer</i> |
| • stride | Distance between subsequent channel IDs | |
| | type | <i>integer</i> |
| | default | null |
| • freq_min | Lower bound of first channel | |
| | type | <i>number</i> |
| • freq_max | Upper bound of last channel | |
| | type | <i>number</i> |
| • link_map | Channel map that specifies which network link is going to get used to send channels to SDP. Intended to allow SDP to optimise network and receive node configuration. | |
| | type | <i>array</i> |
| | default | null |
| | items | |
| additionalProperties | False | |

Processing block 0.3

A Processing Block is an atomic unit of data processing for the purpose of SDP's internal scheduler. Each PB references a processing script and together with the associated execution block provides all parameters necessary to carry out scheduling - both on TM's side for observation planning and on SDP's side - as well as enable processing to locate all required inputs once it is in progress.

PBs are used for both real-time and deferred, batch, processing. An execution block will often contain many Processing Blocks, for example for ingest, self-calibration and Data Product preparation.

1.16.2 ska-sdp-configure

SDP configure 0.4

Example

```
{
  "scan_type": "science"
}
```

Configures an SDP subarray for a number of scans of a certain previously-assigned type. See resource assignment.

| | | | | |
|---|---------|---------------------------------------|--------|-----------------|
| https://schema.skao.int/ska-sdp-configure/0.4 | | | | |
| type | object | | | |
| properties | | | | |
| • interface | type | string | | |
| | default | null | | |
| • transaction_id | type | string | | |
| | pattern | ^txn\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | | |
| | default | null | | |
| • scan_type | type | string | | |
| • new_scan_types | type | array | | |
| | default | null | | |
| | items | type | object | |
| | | properties | | |
| | | • scan_type_id | const | (any scan type) |
| | | • derive_from | type | string |
| | | • beams | type | object |
| | | additionalProperties | False | |
| additionalProperties | False | | | |

SDP configure 0.3

Example

```
{
  "scan_type": "science"
}
```

Example with new scan types

```
{
  "new_scan_types": [{
    "scan_type_id": "new_calibration",
    "channels": [{
      "count": 372,
      "start": 0,
      "stride": 2,
      "freq_min": 350000000.0,
      "freq_max": 358000000.0,
      "link_map": [
        [0, 0],
        [200, 1]
      ]
    }]
  }],
  "scan_type": "new_calibration"
```

(continues on next page)

(continued from previous page)

```
}

```

Configures an SDP subarray for a number of scans of a certain previously-assigned type. See resource assignment.

| | | |
|---|---------|---|
| https://schema.skao.int/ska-sdp-configure/0.3 | | |
| type | object | |
| properties | | |
| • interface | type | string |
| | default | null |

```

Provides information about receive node addresses to use for ingesting measurement data to SDP (such as visibility SPEAD streams).

Receive addresses consists of a map of scan type to a receive address map. This address map must be set once the SDP subarray finishes the transition following `AssignResources` (i.e. IDLE following the current state of ADR-8). TMC will then check SDP's subarray `receiveAddresses` attribute when preparing to configure elements for a certain scan type.

Note that this has been changed to use the more compact channel map format defined in ADR-4. The general idea still applies: A map is given as a list, each entry of the format `[start_channel, value]`. The first entry specifies the first channel ID the map applies to. So in the example, the host for channels 0-399 is "192.168.0.1", while the host for channels 400-799 is "192.168.0.2" and so forth.

A minor extension applies to the port map, where every map entry is given as `[start_channel, start_value, increment]`. The true value for a channel is given from the applicable map entry by:

$$\text{value} = \text{start_value} + (\text{channel} - \text{start_channel}) * \text{increment}$$

So in the example, channels 0-399 should be sent to host "192.168.0.1" at ports 9000-9399, and channels 400-799 to host "192.168.0.2" at ports 9000-9399. If we had said `"port": [[0, 9000, 0]]` all packets would be sent to the same port. Equally `"port": [[0, 9000, 2]]` would indicate spacing the ports out by steps of 2.

Unused channel IDs should be ignored. This especially applies to unused gaps and channel ID strides possibly resulting

from averaging at CBF. This means that with an averaging degree of 2 (see channelAveragingMap in ADR-4), only every second channel ID would be used in the example above.

Provides information about receive node addresses to use for ingesting measurement data to SDP (such as visibility SPEAD streams).

Receive addresses consists of a map of scan type to a receive address map. This address map must be set once the SDP subarray finishes the transition following `AssignResources` (i.e. IDLE following the current state of ADR-8). TMC will then check SDP's subarray `receiveAddresses` attribute when preparing to configure elements for a certain scan type.

Note that this has been changed to use the more compact channel map format defined in ADR-4. The general idea still applies: A map is given as a list, each entry of the format `[start_channel, value]`. The first entry specifies the first channel ID the map applies to. So in the example, the host for channels 0-399 is "192.168.0.1", while the host for channels 400-799 is "192.168.0.2" and so forth.

A minor extension applies to the port map, where every map entry is given as `[start_channel, start_value, increment]`. The true value for a channel is given from the applicable map entry by:

$$\text{value} = \text{start_value} + (\text{channel} - \text{start_channel}) * \text{increment}$$

So in the example, channels 0-399 should be sent to host "192.168.0.1" at ports 9000-9399, and channels 400-799 to host "192.168.0.2" at ports 9000-9399. If we had said `"port": [[0, 9000, 0]]` all packets would be sent to the same port. Equally `"port": [[0, 9000, 2]]` would indicate spacing the ports out by steps of 2.

Unused channel IDs should be ignored. This especially applies to unused gaps and channel ID strides possibly resulting from averaging at CBF. This means that with an averaging degree of 2 (see `channelAveragingMap` in ADR-4), only every second channel ID would be used in the example above.

Beam 0.4

Beam parameters for the purpose of the Science Data Processor.

| | | |
|----------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • beam_id | Name to identify the beam within the SDP configuration. | |
| | type | <i>string</i> |
| • function | <p>Identifies the type and origin of the generated beam data. This corresponds to a certain kind of calibration or receive functionality SDP is meant to provide for it.</p> <p>Possible options:</p> <ul style="list-style-type: none"> • <i>visibilities</i>: Correlated voltages from CBF used for calibration and imaging • <i>pulsar search</i>: SDP provides calibrations for tied-array beam as well as post-processes and delivers pulsar search data products • <i>pulsar timing</i>: SDP provides calibrations for tied-array beam as well as post-processes and delivers pulsar timing data products • <i>vlbi</i>: SDP provides calibrations for tied-array beam • <i>transient buffer</i>: SDP receives and delivers transient buffer data dumps | |
| | enum | visibilities, pulsar search, pulsar timing, vlbi, transient buffer |
| • search_beam_id | type | <i>integer</i> |
| | default | null |
| • timing_beam_id | type | <i>integer</i> |
| | default | null |
| • vlbi_beam_id | type | <i>integer</i> |
| | default | null |
| additionalProperties | False | |

Scan channels 0.4

Spectral windows per channel configuration.

| | | | |
|----------------------|---------------|----------------------|---|
| type | <i>object</i> | | |
| properties | | | |
| • channels_id | | | |
| • spectral_windows | type | <i>array</i> | |
| | items | type | <i>object</i> |
| | | properties | |
| | | • spectral_window_id | |
| | | • count | Number of channels |
| | | type | <i>integer</i> |
| | | • start | First channel ID |
| | | type | <i>integer</i> |
| | | • stride | Distance between subsequent channel IDs |
| | | type | <i>integer</i> |
| | | default | null |
| | | • freq_min | Lower bound of first channel |
| | | type | <i>number</i> |
| | | • freq_max | Upper bound of last channel |
| | | type | <i>number</i> |
| | | • link_map | Channel map that specifies which network link is going to get used to send channels to SDP. Intended to allow SDP to optimise network and receive node configuration. |
| | | type | <i>array</i> |
| | | default | null |
| | | items | |
| | | additionalProperties | False |
| additionalProperties | False | | |

Processing block 0.4

A Processing Block is an atomic unit of data processing for the purpose of SDP's internal scheduler. Each PB references a processing script and together with the associated execution block provides all parameters necessary to carry out scheduling - both on TM's side for observation planning and on SDP's side - as well as enable processing to locate all required inputs once it is in progress.

PBs are used for both real-time and deferred, batch, processing. An execution block will often contain many Processing Blocks, for example for ingest, self-calibration and Data Product preparation.

| | | | |
|-----------------|--|---|-----------------|
| type | <i>object</i> | | |
| properties | | | |
| • pb_id | Unique identifier for this processing block. | | |
| | type | <i>string</i> | |
| | pattern | ^pb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| • script | Specification of the workflow to be executed along with configuration parameters for the workflow. | | |
| | type | <i>object</i> | |
| | properties | | |
| | • kind | The kind of processing script (realtime or batch) | |
| | | allOf | type |
| enum | | | realtime, batch |

continues on next page

Table 55 – continued from previous page

| | | | | | |
|---------------------------|---|--|---------------------------------------|--------------------------------------|--------|
| | • name | The name of the processing script | | | |
| | | type | string | | |
| | • version | Version of the processing script. Uses semantic versioning. | | | |
| | | type | string | | |
| | additionalProp- erties | False | | | |
| • param- eters | Configuration parameters needed to execute the workflow. As these parameters will be workflow specific, this is left as an object to be specified by the workflow definition. | | | | |
| | type | object | | | |
| | default | null | | | |
| • depen- dencies | A dependency between processing blocks means that one processing block requires something from the other processing block to run - typically an intermediate Data Product. This generally means that <ol style="list-style-type: none">1. The dependent processing block might only be able to start once the dependency has been fulfilled2. Data associated with the dependency must be kept alive until the dependent processing block is finished. As processing blocks might have many different outputs, the dependency “kind” can be used to specify how this dependency is meant to be interpreted (e.g. “visibilities”, “calibration”...) | | | | |
| | type | array | | | |
| | default | null | | | |
| | items | type | object | | |
| | | properties | | | |
| | | • pb_id | type | string | |
| | | | pattern | ^pb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| | | • kind | type | array | |
| | | | items | type | string |
| | additionalProp- erties | False | | | |
| | • sbi_ids | Scheduling block instances that the processing block belongs to. | | | |
| type | | array | | | |
| default | | null | | | |
| items | | type | string | | |
| | | pattern | ^sbi\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | | |
| additionalProp- erties | False | | | | |

| | | type | <i>integer</i> |
| | | default | null |
| | | • freq_min | Lower bound of first channel |
| | | type | <i>number</i> |
| | | • freq_max | Upper bound of last channel |
| | | type | <i>number</i> |
| | | • link_map | Channel map that specifies which network link is going to get used to send channels to SDP. Intended to allow SDP to optimise network and receive node configuration. |
| | | type | <i>array</i> |
| | | default | null |
| | | items | |
| | | additionalProperties | False |
| additionalProperties | False | | |

Processing block 0.4

A Processing Block is an atomic unit of data processing for the purpose of SDP's internal scheduler. Each PB references a processing script and together with the associated execution block provides all parameters necessary to carry out scheduling - both on TM's side for observation planning and on SDP's side - as well as enable processing to locate all required inputs once it is in progress.

PBs are used for both real-time and deferred, batch, processing. An execution block will often contain many Processing Blocks, for example for ingest, self-calibration and Data Product preparation.

| | | | |
|-----------------|--|---|-----------------|
| type | | <i>object</i> | |
| properties | | | |
| • pb_id | Unique identifier for this processing block. | | |
| | type | <i>string</i> | |
| | pattern | ^pb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| • script | Specification of the workflow to be executed along with configuration parameters for the workflow. | | |
| | type | <i>object</i> | |
| | properties | | |
| | • kind | The kind of processing script (realtime or batch) | |
| | | allOf | type |
| enum | | | realtime, batch |

continues on next page

Table 58 – continued from previous page

| | | | | | |
|-----------------------|---|---|---------------------------------------|--------------------------------------|--------|
| | • name | The name of the processing script | | | |
| | | type | string | | |
| | • version | Version of the processing script. Uses semantic versioning. | | | |
| | | type | string | | |
| | additionalProperties | False | | | |
| • parameters | Configuration parameters needed to execute the workflow. As these parameters will be workflow specific, this is left as an object to be specified by the workflow definition. | | | | |
| | type | object | | | |
| | default | null | | | |
| • dependencies | A dependency between processing blocks means that one processing block requires something from the other processing block to run - typically an intermediate Data Product. This generally means that <ol style="list-style-type: none">1. The dependent processing block might only be able to start once the dependency has been fulfilled2. Data associated with the dependency must be kept alive until the dependent processing block is finished. As processing blocks might have many different outputs, the dependency “kind” can be used to specify how this dependency is meant to be interpreted (e.g. “visibilities”, “calibration”...) | | | | |
| | type | array | | | |
| | default | null | | | |
| | items | type | object | | |
| | | properties | | | |
| | | • pb_id | type | string | |
| | | | pattern | ^pb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| | | • kind | type | array | |
| | | | items | type | string |
| | additionalProperties | False | | | |
| • sbi_ids | Scheduling block instances that the processing block belongs to. | | | | |
| | type | array | | | |
| | default | null | | | |
| | items | type | string | | |
| | | pattern | ^sbi\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | | |
| additionalProperties | False | | | | |

Beam 0.4

Beam parameters for the purpose of the Science Data Processor.

| | | |
|----------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • beam_id | Name to identify the beam within the SDP configuration. | |
| | type | <i>string</i> |
| • function | <p>Identifies the type and origin of the generated beam data. This corresponds to a certain kind of calibration or receive functionality SDP is meant to provide for it.</p> <p>Possible options:</p> <ul style="list-style-type: none"> • <i>visibilities</i>: Correlated voltages from CBF used for calibration and imaging • <i>pulsar search</i>: SDP provides calibrations for tied-array beam as well as post-processes and delivers pulsar search data products • <i>pulsar timing</i>: SDP provides calibrations for tied-array beam as well as post-processes and delivers pulsar timing data products • <i>vlbi</i>: SDP provides calibrations for tied-array beam • <i>transient buffer</i>: SDP receives and delivers transient buffer data dumps | |
| | enum | visibilities, pulsar search, pulsar timing, vlbi, transient buffer |
| • search_beam_id | type | <i>integer</i> |
| | default | null |
| • timing_beam_id | type | <i>integer</i> |
| | default | null |
| • vlbi_beam_id | type | <i>integer</i> |
| | default | null |
| additionalProperties | False | |

Scan channels 0.4

Spectral windows per channel configuration.

| | | | |
|----------------------|---------------|----------------------|---|
| type | <i>object</i> | | |
| properties | | | |
| • channels_id | | | |
| • spectral_windows | type | <i>array</i> | |
| | items | type | <i>object</i> |
| | | properties | |
| | | • spectral_window_id | |
| | | • count | Number of channels |
| | | type | <i>integer</i> |
| | | • start | First channel ID |
| | | type | <i>integer</i> |
| | | • stride | Distance between subsequent channel IDs |
| | | type | <i>integer</i> |
| | | default | null |
| | | • freq_min | Lower bound of first channel |
| | | type | <i>number</i> |
| | | • freq_max | Upper bound of last channel |
| | | type | <i>number</i> |
| | | • link_map | Channel map that specifies which network link is going to get used to send channels to SDP. Intended to allow SDP to optimise network and receive node configuration. |
| | | type | <i>array</i> |
| | | default | null |
| | | items | |
| | | additionalProperties | False |
| additionalProperties | False | | |

Processing block 0.4

A Processing Block is an atomic unit of data processing for the purpose of SDP's internal scheduler. Each PB references a processing script and together with the associated execution block provides all parameters necessary to carry out scheduling - both on TM's side for observation planning and on SDP's side - as well as enable processing to locate all required inputs once it is in progress.

PBs are used for both real-time and deferred, batch, processing. An execution block will often contain many Processing Blocks, for example for ingest, self-calibration and Data Product preparation.

| | | | |
|-----------------|--|---|-----------------|
| type | | <i>object</i> | |
| properties | | | |
| • pb_id | Unique identifier for this processing block. | | |
| | type | <i>string</i> | |
| | pattern | ^pb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| • script | Specification of the workflow to be executed along with configuration parameters for the workflow. | | |
| | type | <i>object</i> | |
| | properties | | |
| | • kind | The kind of processing script (realtime or batch) | |
| | | allOf | type |
| enum | | | realtime, batch |

continues on next page

Table 61 – continued from previous page

| | | | | | |
|-----------------------|---|---|---------------------------------------|--------------------------------------|---------------|
| | • name | The name of the processing script | | | |
| | | type | <i>string</i> | | |
| | • version | Version of the processing script. Uses semantic versioning. | | | |
| | | type | <i>string</i> | | |
| | additionalProperties | False | | | |
| • parameters | Configuration parameters needed to execute the workflow. As these parameters will be workflow specific, this is left as an object to be specified by the workflow definition. | | | | |
| | type | <i>object</i> | | | |
| | default | null | | | |
| • dependencies | A dependency between processing blocks means that one processing block requires something from the other processing block to run - typically an intermediate Data Product. This generally means that <ol style="list-style-type: none">1. The dependent processing block might only be able to start once the dependency has been fulfilled2. Data associated with the dependency must be kept alive until the dependent processing block is finished. As processing blocks might have many different outputs, the dependency “kind” can be used to specify how this dependency is meant to be interpreted (e.g. “visibilities”, “calibration”...) | | | | |
| | type | <i>array</i> | | | |
| | default | null | | | |
| | items | type | <i>object</i> | | |
| | | properties | | | |
| | | • pb_id | type | <i>string</i> | |
| | | | pattern | ^pb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| | | • kind | type | <i>array</i> | |
| | | | items | type | <i>string</i> |
| | additionalProperties | False | | | |
| • sbi_ids | Scheduling block instances that the processing block belongs to. | | | | |
| | type | <i>array</i> | | | |
| | default | null | | | |
| | items | type | <i>string</i> | | |
| | | pattern | ^sbi\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | | |
| additionalProperties | False | | | | |

LOWCBF resources 0.1

| | | |
|----------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • device | Name of FSP or P4 device | |
| | type | <i>string</i> |
| • shared | Whether device is shared with other subarrays | |
| | type | <i>boolean</i> |
| • fw_image | Name of firmware image to load on device | |
| | type | <i>string</i> |
| | default | <i>null</i> |
| • fw_mode | Mode in which firmware runs | |
| | type | <i>string</i> |
| | default | <i>null</i> |
| additionalProperties | False | |

Low TMC assign resources 2.0

Example JSON.

```

| | | | properties | | |
| | | | • sub-ar-ray_beam_id | ID of MCCS sub-array beam to configure. ID must be an integer between 1 and 48. | |

ray_beam_id continues on next page

continues on next page

Table 62 – continued from previous page

| | | | | | | | |
|--|--|--|-------------------|---|---------|---------|---------|
| | | | | type | integer | | |
| | | | • station_ids | IDs of MCCA stations within this sub-array beam to configure. Array size must be less than 512, the maximum number of MCCA stations. Each item in the list must be an integer between 1 and 512. | | | |
| | | | | type | array | | |
| | | | | items | type | integer | |
| | | | • update_rate | Update rate for pointing information. Value must be 0.0 or greater. TODO: clarify whether this is specified as a frequency or as a cadence, plus units. | | | |
| | | | | type | number | | |
| | | | • channels | Channel block configurations. Each item in the list is a channel block configuration, each specified as a list of 4 numbers as follows: [start channel, number of channels, beam index, sub-station index] Constraints are: 0 < start channel < 376 start channel must be a multiple of 8 8 < number of channels < 48 1 < beam index < 48 1 < sub-station index < 8 | | | |
| | | | | type | array | | |
| | | | | items | type | array | |
| | | | | | items | type | integer |
| | | | • antenna_weights | Antenna weights. Minimum array size = 512 (=256 antennas x2 pols per sub-array beam). Antennas signals can be weighted to modify the station beam, varying from 0.0 for full exclusion to potentially 256.0 for an antenna contribution compensated for the number of antennas in the beam. This value is an amplitude multiplier added to that antenna signal before adding into the sum. Weights apply to all channels assigned to a beam. | | | |
| | | | | type | array | | |
| | | | | items | type | number | |
| | | | • phase_centre | Phase centre offset for the station beam, in metres. The reference position for station phase must be modified to reflect antenna weighting and their contribution to the station beam. This offset can be considered the desired centre of mass for the station. Constraints: array size = 2-20 < phase centre value < 20 | | | |
| | | | | type | array | | |
| | | | | items | type | number | |
| | | | • target | Target position for the sub-array beam. Only drift scan targets are currently implemented by MCCA, hence only azimuth and elevation are specified. | | | |
| | | | | type | object | | |

| additional-Properties | False | | | | |

Common configuration schema 4.0

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9\]+\-[0-9]{8}\-[a-z0-9]+\\$</code> |
| | default | null |
| additionalProperties | False | |

LOWCBF subarray configurescan 1.0

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF subsystem. This section is forwarded only to CBF subelement.

| | | | | |
|----------------------|---|------------------------------|---------------|--|
| type | <i>object</i> | | | |
| properties | | | | |

LOW PST configure 2.5

Main configuration for the Low CSP Pulsar timing sub-system

| | | | | |
|----------------------|------------------------------------|--|-----------------------------------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • beams | List of PST Beams IDs to configure | | | |
| | type | <i>array</i> | | |
| | items | Parameters to configure the PST sub-system | | |
| | | type | <i>object</i> | |
| | | properties | | |
| | | • beam_id | Configuration for a PST beam ID | |
| | | | type | <i>integer</i> |
| | | • scan | Parameters to configure the scan | |
| | | | <i>PST scan configuration 2.5</i> | |
| | | • beam | Parameter to configure the beam | |
| | | | default | null |
| | | | <i>PST beam configuration 2.5</i> | |
| additionalProperties | False | | | |
| additionalProperties | False | | | |

PST scan configuration 2.5

Pulsar Timing specific scan configuration parameters.

| | | |
|-------------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| | default | null |
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |

continues on next page

Table 64 – continued from previous page

| | | |
|---------------------------------|---|---|
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |
| • source | The name of the source. Keyword: SRC_NAME | |
| | type | <i>string</i> |
| • itrfr | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | |
| | type | <i>array</i> |
| | items | type <i>number</i> |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | |
| | type | <i>string</i> |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | |

continues on next page

Table 64 – continued from previous page

| | | | |
|------------------------------|---|--------|-------------------|
| | allOf | type | string |
| | | enum | LIN, CIRC |
| • feed_handedness | <p>Code for sense of feed.</p> <p>For value of +1 for XYZ forming RH set with Z in the direction of propagation. Looking up into the feed of a prime-focus receiver or at the sky).</p> <p>For FD_HAND = +1, the rotation from A (or X) to B (or Y) is counter clockwise or in the direction of increasing Feed Angle (FA) or Position Angle (PA).</p> <p>For circular feeds, FD_HAND = +1 for IEEE LCP on the A (or X) probe.</p> <p>Range: -1 or +1 Keyword: FD_HAND</p> | | |
| | allOf | type | integer |
| | | enum | -1, 1 |
| • feed_angle | <p>Feed angle of the E-vector for an equal in-phase response from the A(X) and B(Y) probes, measured in the direction of increasing feed angle or position angle (clockwise when looking down on a prime focuse receiver).</p> <p>Units: degrees Range: -180 to 180. Keyword: FD_SANG</p> | | |
| | type | number | |
| • feed_tracking_mode | <p>The tracking mode for the feed:</p> <ul style="list-style-type: none"> • FA - constant feed angle and that the feed stays fixed with respect to the telescope's reference frame. • CPA - the feed rotates to maintain a constant phase angle (i.e. it tracks the variation of the parallactic angle.). When the cordinate mode is GALATIC, PA is with respect to Galactic north and similarly for coordinate mode ECLIPTIC then PA is with respect to ecliptic north. • SPA - the feed angle is held fixed at an angle such that the requested PA is obtained at the mid-point of the observation. • TPA - is only relevant for scan observations - the feed is rotated to maintain a constant angle with respect to the scan direction. <p>Range: FA, CPA, SPA, or TPA Keyword: FD_MODE</p> | | |
| | allOf | type | string |
| | | enum | FA, CPA, SPA, TPA |
| • feed_position_angle | <p>The requested angle of feed reference.</p> <p>If feed_mode = 'FA' this is respect to the telescope's reference frame (feed_angle = 0), and for feed_mode = 'CPA' this is with respect to the celestial north (parallactic angle = 0) or with respect to the Galactic north for coordinate_mode = 'GALACTIC'.</p> <p>Range: -180 to +180.</p> <p>Keyword: FA_REQ</p> | | |
| | type | number | |
| • oversampling_ratio | <p>The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]).</p> <p>Range: 8/7 or 4/3 Keyword: OVERSAMP</p> | | |
| | type | array | |
| | items | type | integer |
| • coordinates | <p>The tied-array beam's tracking co-ordinates.</p> <p>As of version 2.2 of the schema this only handles equatorial tracking which means uses RA/Dec J2000.0 coords but PST may support different tracking modes and coordinates the future.</p> <p><i>PST RA_Dec coordinates 2.5</i></p> | | |
| • max_scan_length | <p>The maximum length of the observation.</p> <p>Units: seconds Range: 30 - 43200 Keyword: SCANLEN_MAX</p> | | |
| | type | number | |
| • subint_duration | <p>The length of each output sub-integration.</p> <p>Units: seconds Range: 1 - 60 Keyword: OUTSUBINT</p> | | |

Table 64 – continued from previous page

| | | | | | |
|------------------------------------|---|---|---------------|----------------|--|
| | type | <i>number</i> | | | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | | |
| | type | <i>array</i> | | | |
| | items | type | <i>string</i> | | |
| • receptor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | | |
| | type | <i>array</i> | | | |
| | items | type | <i>number</i> | | |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | | |
| | type | <i>integer</i> | | | |
| | default | 0 | | | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges to excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | | |
| | type | <i>array</i> | | | |
| | default | null | | | |
| | items | type | <i>array</i> | | |
| | | items | type | <i>number</i> | |
| | • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | | |
| | | type | <i>array</i> | | |
| default | | null | | | |
| items | | anyOf | type | <i>string</i> | |
| | | | type | <i>integer</i> | |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | | |
| | type | <i>string</i> | | | |
| | default | null | | | |
| • pt | Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration. | | | | |
| | default | null | | | |
| • ds | <i>PST ‘PULSAR_TIMING’ mode configuration 2.5</i> | | | | |
| | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | | | | |
| • ft | default | null | | | |
| | <i>PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.5</i> | | | | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in CBF and 1 in PST * for Mid, there are 2 stages: 1 in FSP and 1 in PST BF. Keyword: NSTAGE | | | | |
| | type | <i>integer</i> | | | |
| • channelization_stages | List of configuration for each channelization stage. | | | | |
| | type | <i>array</i> | | | |
| | items | Pulsar Timing specific parameters for channelization stage configuration. | | | |

| additionalProperties | False | |

PST RA_Dec coordinates 2.5

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.5

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode. |
| | | <i>PST spectral kurtosis configuration 2.5</i> |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.5

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the 'PULSAR_TIMING' mode.

| | | | |
|---|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST 'DYNAMIC_SPECTRUM' mode configuration 2.5

Pulsar Timing specific parameters for the 'DYNAMIC_SPECTRUM' mode configuration.

| | | | |
|--------------------------------------|---|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 65 – continued from previous page

| | | |
|-------------------------|--|--|
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.5</i> |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.5

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|---|---|---|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisa- tion_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • polarizations | The polarizations to be recorded. Valid values: A, B, or Both Keyword: POLN_FT | |
| allOf | | type | <i>string</i> |
| | | enum | A, B, Both |
| • requantisa- tion_init_time | Time interval spanned by data used at the start of a scan to determine the scale factors applied before re-quantisation. Units: seconds Keyword: DIGITIZER_INIT_TIME | | |
| | type | <i>number</i> | |
| | additionalProperties | False | |

PST channelization stage configuration 2.5

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| <ul style="list-style-type: none">• num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| <ul style="list-style-type: none">• num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| <ul style="list-style-type: none">• oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.5

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |

PST scan configuration 2.4

Pulsar Timing specific scan configuration parameters.

| | | |
|-------------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • activation_time | Date and time when to start the PST reconfiguration. Units: UTC timestamp Keyword: ACTIVATION_TIME | |
| | type | <i>string</i> |
| • timing_beam_id | Identifier assigned by LMC/TM used to identify the beam configuraiton. PST selects which PST server to use for this scan and timing beam, and provides a mapping from the timing beam identifier by the TM to PST capability id. Keyword: BEAM | |
| | type | <i>string</i> |
| | default | null |
| • bits_per_sample | The number of bits per complex-values time sample in the CBF output data. Valid values are 16, 24, or 32. Keyword: NBIT | |
| | type | <i>integer</i> |
| • num_of_polarizations | The number of polarizations in the CBF output data. Valid values are 1 or 2. Keyword: NPOL | |
| | type | <i>integer</i> |
| • udp_nsamp | The number of time samples for each single polarization and the a single frequency in each UDP packet sent by CBF. Note: this must be an integer multiple of WT_NSMAP Range: 4 (Low), 32 (Mid) Keyword: UDP_NSAMP | |
| | type | <i>integer</i> |

continues on next page

Table 69 – continued from previous page

| | | |
|---------------------------------|---|---|
| • wt_nsamp | The number of time samples described by as single relative weight. There is a unique relative weight for each frequency channel, and each relative weight describes both polarizations. Range: 4 (Low), 32 (Mid) Keyword: WT_NSAMP | |
| | type | <i>integer</i> |
| • udp_nchan | The number of contiguous frequency channels in each UDP packet sent by CBF. Range: 24 (Low), 185 (Mid) Keyword: UDP_NCHAN | |
| | type | <i>integer</i> |
| • num_frequency_channels | The total number of frequency channels into which the total critical bandwidth has been divided. This must be an integer multiple of udp_nchan Range: 1 to 82944 Keyword: OBSNCHAN | |
| | type | <i>integer</i> |
| • centre_frequency | Centre frequency of to the total (critical) bandwidth spanned by the frequency channels. Units: Hz Range: 50e6 to 12800e6 Keyword: OBSFREQ | |
| | type | <i>number</i> |
| • total_bandwidth | Total (critical) bandwidth spanned by the channels of the observation. Low: 0.00361 to 300 MHz Mid: 0.053.76 to 2500 MHz Units: Hz Range: 3610 to 2.5e9 Keyword: OBSBW | |
| | type | <i>number</i> |
| • observation_mode | The observation mode used for the scan. The value VOLTAGE_RECORDER is added for AA0.5, while the other values will be needed for in the future for data processing. Keyword: OBSMODE | |
| | allOf | type <i>string</i> |
| | enum | PULSAR_TIMING, DYNAMIC_SPECTRUM, FLOW_THROUGH, VOLTAGE_RECORDER |
| • observer_id | The observer in charge of the observations. Keyword: OBSERVER | |
| | type | <i>string</i> |
| • project_id | The project that the observations are for. Keyword: PROJID | |
| | type | <i>string</i> |
| • pointing_id | The ID for the sub-array pointing. Keyword: PNT_ID | |
| | type | <i>string</i> |
| • source | The name of the source. Keyword: SRC_NAME | |
| | type | <i>string</i> |
| • itrfr | The International Terrestrial Reference Frame (ITRF) coordinates of the telescope delay centre. Units: metres Keyword: ITRF | |
| | type | <i>array</i> |
| | items | type <i>number</i> |
| • receiver_id | The receiver name or ID (instrument). Keyword: FRONTEND | |
| | type | <i>string</i> |
| • feed_polarization | The native polarization of feed. Range: LIN or CIRC Keyword: FD_POLN | |

|---------------------------------|---|---|--------|---------|--|
| | type | number | | | |
| • receptors | An array of receptor IDs for the receptors included in the sub-array. Keyword: ANTENNA | | | | |
| | type | array | | | |
| | items | type | string | | |
| • recep- tor_weights | Weight for each receptor. Range: 0 - 1.0 Keyword: ANT_WEIGHTS | | | | |
| | type | array | | | |
| | items | type | number | | |
| • num_rfi_frequency_mask | The number of frequency ranges to be masked. Range: 0 - 1024 Keyword: NMASK | | | | |
| | type | integer | | | |
| | default | 0 | | | |
| • rfi_frequency_mask | A two-dimensional array of length of num_frequency_mask of known RFI frequency ranges to excise from the data. The array contains mask pairs of [f_min, f_max] pairs for known frequency ranges containing RFI not excised by the CBF. The overall dimension of this array is num_frequency_mask x 2. Units: Hz Keyword: FREQ_MASK | | | | |
| | type | array | | | |
| | default | null | | | |
| | items | type | array | | |
| | | items | type | number | |
| | • destination_address | The destination address for the PST output data. Includes IPv4 Address, port number. | | | |
| | | type | array | | |
| default | | null | | | |
| items | | anyOf | type | string | |
| | | | type | integer | |
| • test_vector_id | Identifier for a test vectore that will be present in the tied-array beam data stream beam CBF and PST. Keyword: TEST_VECTOR | | | | |
| | type | string | | | |
| | default | null | | | |
| • pt | Pulsar Timing specific parameters for the ‘PULSAR_TIMING’ mode configuration. | | | | |
| | default | null | | | |
| | PST ‘PULSAR_TIMING’ mode configuration 2.4 | | | | |
| • ds | Pulsar Timing specific parameters for the ‘DYNAMIC_SPECTRUM’ mode configuration. | | | | |
| | default | null | | | |
| | PST ‘DYNAMIC_SPECTRUM’ mode configuration 2.4 | | | | |
| • ft | Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration. | | | | |
| | default | null | | | |
| | PST ‘FLOW_THROUGH’ mode configuration 2.4 | | | | |
| • num_channelization_stages | The number of stages used to channelize the data: e.g. * for Low, there are 2 stages: 1 in CBF and 1 in PST * for Mid, there are 2 stages: 1 in FSP and 1 in PST BF. Keyword: NSTAGE | | | | |
| | type | integer | | | |
| • channelization_stages | List of configuration for each channelization stage. | | | | |
| | type | array | | | |
| | items | Pulsar Timing specific parameters for channelization stage configuration. | | | |

| additionalProperties | False | |

PST RA_Dec coordinates 2.4

Pulsar Timing specific parameters for RA/Dec tracking coordinates.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • equinox | The coordinate epoch. This can be in Julian date or Modified Julian Date. Units: years Range: >= 2000 Keyword: EQUINOX | |
| | type | <i>number</i> |
| | default | 2000.0 |
| • ra | The Right Accession (RA) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD1 | |
| | type | <i>string</i> |
| • dec | The declination (Dec) of the coordinates used for tracking. Valid formats is 'hh:mm:ss.sss' or 'ddd.ddd' Keyword: STT_CTD2 | |
| | type | <i>string</i> |
| additionalProperties | False | |

PST 'PULSAR_TIMING' mode configuration 2.4

Pulsar Timing specific parameters for the 'PULSAR_TIMING' mode configuration.

| | | |
|------------------------------------|--|--|
| type | <i>object</i> | |
| properties | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. Units: pccm ⁻³ Range: 0 - 100000 Keyword: DM | |
| | type | <i>number</i> |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | |
| | type | <i>number</i> |
| | default | null |
| • ephemeris | The ephemeris of the pulsar being observed. Units: PSRCAT compatible ASCII string Keyword: EPHEMERIS | |
| | type | <i>string</i> |
| • pulsar_phase_predictor | Pulsar phase predictor generated from ephemeris. Units: TEMPO2 compatible ASCII string Keyword: PREDICTOR | |
| | type | <i>string</i> |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | |
| | type | <i>integer</i> |
| • output_phase_bins | The number of output phase bins. Range: 64 - 2048 Keyword: OUTNBIN | |
| | type | <i>integer</i> |
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. |
| | | <i>PST spectral kurtosis configuration 2.4</i> |
| • target_snr | The signal-to-noise ratio (SNR) of the on-pulse flux for the scan. May be used to prematurely end a scan when the integrated SNR reaches the target. A value of 0 indicates there is no limit. Keyword: TARGET_SNR | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST spectral kurtosis configuration 2.4

Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode.

| | | | |
|-------------------------------|--|----------------|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • sk_range | Frequency ranges for each spectral kurtosis (SK) configuration. Units: Hz Keyword: SK_RNG | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| • sk_integration_limit | The number of input time samples integrated into each spectral kurtosis (SK) statistic. Range: 64 - 1024 Keyword: SK_INTS | | |
| | type | <i>integer</i> | |
| • sk_excision_limit | Spectral kurtosis excision limits (RFI threshold) in units of standard deviations. Range: 1 - 100 Keyword: SK_EXIS | | |
| | type | <i>number</i> | |
| additionalProperties | False | | |

PST 'DYNAMIC_SPECTRUM' mode configuration 2.4

Pulsar Timing specific parameters for the 'DYNAMIC_SPECTRUM' mode configuration.

| | | | |
|--------------------------------------|---|----------------|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • dispersion_measure | The dispersion measure for coherent/incoherent de-dispersion. This is only required for pulsar timing and dynamic spectrum modes. Range: [0, 100000] Keyword: DM | | |
| | type | <i>number</i> | |
| • rotation_measure | The rotation measure for phase-coherent Faraday rotation correction. Units: radians per metre squared Keyword: RM | | |
| | type | <i>number</i> | |
| | default | null | |
| • output_frequency_channels | The number of output frequency channels. This must be between 1 and the number of observation channels. Keyword: OUTNCHAN | | |
| | type | <i>integer</i> | |
| • stokes_parameters | The Stokes parameters to output when in Dynamic spectrum mode. Range: string with a combination of I, Q, U, and V. Keyword: STOKES_FB | | |
| | type | <i>string</i> | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • time_decimation_factor | The number of input samples per output time sample when in Dynamic Spectrum mode. Keyword: TDEC_FB | | |
| | type | <i>integer</i> | |
| • frequency_decimation_factor | The number of input frequency channels incoherently added to each output frequency channel in Dynamic Spectrum. This is required in addition to output_frequency_channels because some frequency channels may be merged coherently to increase temporal resolution. Keyword: FDEC_FB | | |
| | type | <i>integer</i> | |

continues on next page

Table 70 – continued from previous page

| | | |
|-------------------------|--|--|
| • num_sk_config | The number of spectral kurtosis (SK) configurations to apply. Keyword: N_SK | |
| | type | <i>integer</i> |
| | default | null |
| • sk_config | List of spectral kurtosis configurations. | |
| | type | <i>array</i> |
| | default | null |
| | items | Pulsar Timing specific parameters for the spectral kurtosis (SK) for the ‘PULSAR_TIMING’ mode. <i>PST spectral kurtosis configuration 2.4</i> |
| • requantisation_scale | Scale factor to govern the dynamic range for fixed precision output to be applied during re-quantisation. Keyword: DIGITIZER_SCALE | |
| | type | <i>number</i> |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | |
| | type | <i>number</i> |
| additionalProperties | False | |

PST ‘FLOW_THROUGH’ mode configuration 2.4

Pulsar Timing specific parameters for the ‘FLOW_THROUGH’ mode configuration.

| | | | |
|--------------------------------|---|--|--------------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_bits_out | The number of bits per output sample. Range: 1, 2, 4, 8, 16 or 32 Keyword: NBIT_OUT | | |
| | allOf | type | <i>integer</i> |
| | | enum | 1, 2, 4, 8, 16, 32 |
| • channels | The indices of the first and last (inclusive) frequency channels that define the single contiguous range of frequency channels to be recorded. Keyword: CHAN_FT | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| • requantisation_scale | Scale factor applied during re-quantisation that modifies the dynamic range of the fixed precision output. By default, for 2, 4, and 8 bits per sample, data will be scaled to minimize scattered power by adopting the Optimum Input Threshold Spacing for a Uniform Digitizer defined in Table 3 of Jenet & Anderson (1998; PASP 110:1467). For 16 and 32 bits per sample, by default the data will be scaled such that the maximum fixed precision output value ($2^{\{\text{num_bits_out}-1\}}$) corresponds to 6 times the standard deviation. For all num_bits_out, the standard deviation is that of either the real or imaginary part of each complex-valued sample. The default scale factor is computed such that, after multiplication by this scale factor, the data would satisfy the conditions described above. This default scale factor is multiplied by requantisation_scale. Therefore, a requantisation_scale value greater than 1 increases the value of the floating point data before it is cast to a fixed precision value, thereby reducing the overhead available to represent RFI and increasing the probability of clipping. Keyword: DIGITIZER_SCALE | | |
| | type | <i>number</i> | |
| | • num_channels | The number of input channels to be recorded. This value must be less than or equal to the output_frequency_channels. Keyword: NCHAN_FT | |
| type | | <i>integer</i> | |
| • requantisation_length | Length of data to be used when determining the scaling factors used for fixed precision output during re-quantisation. Units: seconds Keyword: DIGITIZER_LENGTH | | |
| | type | <i>number</i> | |
| | additionalProperties | False | |

PST channelization stage configuration 2.4

Pulsar Timing specific parameters for channelization stage configuration.

| | | | |
|---------------------------------|---|----------------|----------------|
| type | <i>object</i> | | |
| properties | | | |
| • num_filter_taps | Total number of taps in the prototype filter (i.e. over all arms) used in the stage. Keyword: NSTAP_k | | |
| | type | <i>integer</i> | |
| • filter_coefficients | An array of filter coefficients that define the (time domain) response function of the prototype filter used in the stage. Length of this is num_filter_taps. Keyword: COEFF_k | | |
| | type | <i>array</i> | |
| | items | type | <i>number</i> |
| • num_frequency_channels | The number of frequency channels output by each polyphase filter bank (PFB) for this stage. Keyword: NCHAN_PFB_k | | |
| | type | <i>integer</i> | |
| • oversampling_ratio | The oversampling ratio expressed as a fraction as an array of int, with the first value the numerator and the second is the denominator. (e.g. 8/7 is assigned as [8,7]). Keyword: OVERSAMP_k | | |
| | type | <i>array</i> | |
| | items | type | <i>integer</i> |
| additionalProperties | False | | |

PST beam configuration 2.4

Pulsar Timing specific beam configuration parameters.

As of version 2.3 this schema has no elements and is deprecated

| | |
|----------------------|---------------|

| | | | | type | integer |

continues on next page

Table 71 – continued from previous page

| | | | | | | | |
|--|--|--|--------------------------|---|---|--------|---------|
| | | | • station_ids | IDs of MCCS stations within this sub-array beam to configuration. Array size must be less than 512, the maximum number of MCCS stations. Each item in the list must be an integer between 1 and 512. | | | |
| | | | | type | | array | |
| | | | | items | | type | integer |
| | | | • update_rate | Update rate for pointing information. Value must be 0.0 or greater. TODO: clarify whether this is specified as a frequency or as a cadence, plus units. | | | |
| | | | | type | | number | |
| | | | | • channels | Channel block configurations. Each item in the list is a channel block configuration, each specified as a list of 4 numbers as follows: [start channel, number of channels, beam index, sub-station index] Constraints are: 0 < start channel < 376 start channel must be a multiple of 8 8 < number of channels < 48 1 < beam index < 48 1 < sub-station index < 8 | | |
| | | | type | | array | | |
| | | | items | | type | array | |
| | | | | | items | type | integer |
| | | | • antenna_weights | Antenna weights. Maximum array size = 512 (=256 antennas x2 pols per sub-array beam). Antennas signals can be weighted to modify the station beam, varying from 0.0 for full exclusion to potentially 256.0 for an antenna contribution compensated for the number of antennas in the beam. This value is an amplitude multiplier added to that antenna signal before adding into the sum. Weights apply to all channels assigned to a beam. | | | |
| | | | | type | | array | |
| | | | | items | | type | number |
| | | | • phase_centre | Phase centre offset for the station beam, in metres. The reference position for station phase must be modified to reflect antenna weighting and their contribution to the station beam. This offset can be considered the desired centre of mass for the station. Constraints: array size = 2 -20 < phase centre value < 20 | | | |
| | | | | type | | array | |
| | | | | items | | type | number |
| | | | • target | Target position for the sub-array beam. Only drift scan targets are currently implemented by MCCS, hence only azimuth and elevation are specified. | | | |
| | | | | type | | object | |
| | | | | properties | | | |

| • subarray_id | ID of the sub-array which should release resources. | |
| | type | <i>integer</i> |
| • release_all | true to release all resources, false to release only the resources defined in this payload. Note: partial resource release for SKA LOW is not implemented and the identification of the resources to release is not yet part of the schema. | |
| | type | <i>boolean</i> |
| additionalProperties | False | |

Low TMC resource release 2.0

Example JSON.

```
{
  "interface": "https://schema.skao.in/ska-low-tmc-releaseresources/2.0",
  "transaction_id": "txn-....-00001",
  "subarray_id": 1,
  "release_all": true
}
```

| | | |
|---|--|----------------|
| https://schema.skao.int/ska-low-tmc-releaseresources/2.0 | | |
| type | <i>object</i> | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | <i>string</i> |
| • transaction_id | A transaction id specific to the command | |
| | type | <i>string</i> |
| | default | <i>null</i> |
| • subarray_id | ID of the sub-array which should release resources. | |
| | type | <i>integer</i> |
| • release_all | true to release all resources, false to release only the resources defined in this payload. Note: partial resource release for SKA LOW is not implemented and the identification of the resources to release is not yet part of the schema. | |
| | type | <i>boolean</i> |
| additionalProperties | False | |

Low TMC resource release 1.0

Example JSON.

```
{
  "interface": "https://schema.skatelescope.org/ska-low-tmc-releaseresources/1.0",
  "subarray_id": 1,
  "release_all": true
}
```

| | | |
|---|--|----------------|
| https://schema.skatelescope.org/ska-low-tmc-releaseresources/1.0 | | |
| type | <i>object</i> | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | <i>string</i> |
| • subarray_id | ID of the sub-array which should release resources. | |
| | type | <i>integer</i> |
| • release_all | true to release all resources, false to release only the resources defined in this payload. Note: partial resource release for SKA LOW is not implemented and the identification of the resources to release is not yet part of the schema. | |
| | type | <i>boolean</i> |
| additionalProperties | False | |

1.17.4 ska-low-tmc-scan

Low TMC scan 4.0

Example JSON.

```
{
  "interface": "https://schema.skao.int/ska-low-tmc-scan/4.0",
  "transaction_id": "txn-....-00001",
  "scan_id": 1,
  "subarray_id": 1
}
```

| | | |
|--|---|---------|
| https://schema.skao.int/ska-low-tmc-scan/4.0 | | |
| type | object | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | string |
| • transaction_id | A transaction id specific to the command | |
| | type | string |
| | default | null |
| • scan_id | Scan ID to associate with the data. The scan ID and SBI ID are used together to uniquely associate the data taken with the telescope configuration in effect at the moment of observation. | |
| | type | integer |
| • subarray_id | ID of the sub-array which should release resources. | |
| | type | integer |
| additionalProperties | False | |

Low TMC scan 3.0

Example JSON.

```
{
  "interface": "https://schema.skao.int/ska-low-tmc-scan/3.0",
  "transaction_id": "txn-....-00001",
  "scan_id": 1
}
```

| | | |
|--|---|---------|
| https://schema.skao.int/ska-low-tmc-scan/3.0 | | |
| type | object | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | string |
| • transaction_id | A transaction id specific to the command | |
| | type | string |
| | default | null |
| • scan_id | Scan ID to associate with the data. The scan ID and SBI ID are used together to uniquely associate the data taken with the telescope configuration in effect at the moment of observation. | |
| | type | integer |
| additionalProperties | False | |

Low TMC scan 2.0

Example JSON.

```
{
  "interface": "https://schema.skao.in/ska-low-tmc-scan/2.0",
  "transaction_id": "txn-....-00001",
  "scan_id": 1
}
```

| | | |
|---|---|---------|
| https://schema.skao.int/ska-low-tmc-scan/2.0 | | |
| type | object | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | string |
| • transaction_id | A transaction id specific to the command | |
| | type | string |
| | default | null |
| • scan_id | Scan ID to associate with the data. The scan ID and SBI ID are used together to uniquely associate the data taken with the telescope configuration in effect at the moment of observation. | |
| | type | integer |
| additionalProperties | False | |

Low TMC scan 1.0

Example JSON.

```
{
  "interface": "https://schema.skatelescope.org/ska-low-tmc-scan/1.0",
  "scan_id": 1
}
```

| | | |
|---|---|----------------|
| https://schema.skatelescope.org/ska-low-tmc-scan/1.0 | | |
| type | <i>object</i> | |
| properties | | |
| • interface | URI of JSON schema applicable to this JSON payload. | |
| | type | <i>string</i> |
| • transaction_id | A transaction id specific to the command | |
| | type | <i>string</i> |
| | default | null |
| • scan_id | Scan ID to associate with the data. The scan ID and SBI ID are used together to uniquely associate the data taken with the telescope configuration in effect at the moment of observation. | |
| | type | <i>integer</i> |
| additionalProperties | False | |

1.17.5 ska-low-tmc-assignedresources

Low TMC assigned resources 1.0

Example JSON.

```
{
  "interface": "https://schema.skatelescope.org/ska-low-tmc-assignedresources/1.0",
  "mccs": {
    "subarray_beam_ids": [1],
    "station_ids": [
      [1, 2]
    ],
    "channel_blocks": [3]
  }
}
```

| | | | | | |
|---|---|---|--------|-------|---------|
| https://schema.skatelescope.org/ska-low-tmc-assignedresources/1.0 | | | | | |
| type | | object | | | |
| properties | | | | | |
| • interface | URI of JSON schema applicable to this JSON payload. | | | | |
| | type | | string | | |
| • mcs | Specification of the MCS resources allocated to this sub-array. | | | | |
| | type | | object | | |
| | properties | | | | |
| | • subarray_beam_ids | IDs of the MCS sub-array beams allocated to this subarray. Each ID must be between 1 and 48, the maximum number of sub-array beams. | | | |
| | | type | | array | |
| | | items | | type | integer |
| | • station_ids | IDs of MCS stations allocated to each MCS sub-array beam. Each ID must be between 1 and 512, the maximum number of stations. | | | |
| | | type | | array | |
| | | items | type | array | |
| | | | items | type | integer |
| | • channel_blocks | Number of channel blocks allocated per sub-array beam. Maximum number of channel blocks = 48. | | | |
| | | type | | array | |
| | | items | | type | integer |
| additionalProperties | | False | | | |
| additionalProperties | False | | | | |

1.17.6 ska-tmc-assignresources

Mid TMC assign resources 2.1

Example JSON.

```
{
  "interface": "https://schema.skao.int/ska-tmc-assignresources/2.1",

Table 74 – continued from previous page

| | |
|----------------------|-------|
| additionalProperties | False |
|----------------------|-------|

Beam 0.4

Beam parameters for the purpose of the Science Data Processor.

| | | |
|----------------------|---|--|
| type | <i>object</i> | |
| properties | | |
| • beam_id | Name to identify the beam within the SDP configuration. | |
| | type | <i>string</i> |
| • function | Identifies the type and origin of the generated beam data. This corresponds to a certain kind of calibration or receive functionality SDP is meant to provide for it. Possible options: <ul style="list-style-type: none"> • <i>visibilities</i>: Correlated voltages from CBF used for calibration and imaging • <i>pulsar search</i>: SDP provides calibrations for tied-array beam as well as post-processes and delivers pulsar search data products • <i>pulsar timing</i>: SDP provides calibrations for tied-array beam as well as post-processes and delivers pulsar timing data products • <i>vlbi</i>: SDP provides calibrations for tied-array beam • <i>transient buffer</i>: SDP receives and delivers transient buffer data dumps | |
| | enum | visibilities, pulsar search, pulsar timing, vlbi, transient buffer |
| • search_beam_id | type | <i>integer</i> |
| | default | null |
| • timing_beam_id | type | <i>integer</i> |
| | default | null |
| • vlbi_beam_id | type | <i>integer</i> |
| | default | null |
| additionalProperties | False | |

Scan channels 0.4

Spectral windows per channel configuration.

| | | | |
|----------------------|---------------|----------------------|---|
| type | <i>object</i> | | |
| properties | | | |
| • channels_id | | | |
| • spectral_windows | type | <i>array</i> | |
| | items | type | <i>object</i> |
| | | properties | |
| | | • spectral_window_id | |
| | | • count | Number of channels |
| | | type | <i>integer</i> |
| | | • start | First channel ID |
| | | type | <i>integer</i> |
| | | • stride | Distance between subsequent channel IDs |
| | | type | <i>integer</i> |

Processing block 0.4

A Processing Block is an atomic unit of data processing for the purpose of SDP's internal scheduler. Each PB references a processing script and together with the associated execution block provides all parameters necessary to carry out scheduling - both on TM's side for observation planning and on SDP's side - as well as enable processing to locate all required inputs once it is in progress.

PBs are used for both real-time and deferred, batch, processing. An execution block will often contain many Processing Blocks, for example for ingest, self-calibration and Data Product preparation.

| | | | |
|-----------------|--|---|-----------------|
| type | | <i>object</i> | |
| properties | | | |
| • pb_id | Unique identifier for this processing block. | | |
| | type | <i>string</i> | |
| | pattern | ^pb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| • script | Specification of the workflow to be executed along with configuration parameters for the workflow. | | |
| | type | <i>object</i> | |
| | properties | | |
| | • kind | The kind of processing script (realtime or batch) | |
| | | allOf | type |
| enum | | | realtime, batch |

Common configuration schema 2.0

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | | |
|----------------------|--|---|---------------|
| type | <i>object</i> | | |
| properties | | | |
| • config_id | type | <i>string</i> | |
| | default | null | |
| • subarray_id | Subarray number | | |
| | type | <i>integer</i> | |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | | |
| | type | <i>string</i> | |
| | pattern | ^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$ | |
| | default | null | |
| | • band_5_tuning | Center frequency for the Band-of-Interest. Required if Band is 5a or 5b; not specified for other Bands (not configurable for Band 1, 2, 3 and 4). Input for Band 5a and 5b consists of two 2.5 GHz streams; the center frequency can be independently tuned for each stream. The following nomenclature is used to refer to Band 5a and 5b streams: 5a1, 5a2, 5b1, 5b2. | |
| type | | <i>array</i> | |
| default | | null | |
| items | | type | <i>number</i> |
| • frequency_band | | Frequency band applies for all the receptors (VCCs) that belong to the sub-array. | |
| | type | <i>string</i> | |
| | pattern | ^(1 2 3 4 5(a b))\$ | |
| additionalProperties | False | | |

CBF config 2.0

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-element. This section is forwarded only to CBF subelement. Most of it to be borrowed from IICD

| type | object | | |
|---|---|---|------|
| properties | | | |
| <ul style="list-style-type: none">frequency_band_offset_stream1 | Optionally, an offset can be specified so that the entire observed band is shifted (to accommodate a Zoom Window that crosses a ‘natural’ Frequency Slice boundary). If specified, applies for all the receptors in the sub-array. Bands 1, 2, 3 and 4: input from the receptor consists of a single data stream; the Frequency Band Offset (FBO) should be specified for Stream 1 only. Bands 5a and 5b: input from the receptor consists of two data streams; the FBO can be specified for each stream independently. Note: For Band 5a and 5b the frequency shift is performed by the receptor (DISH). Note: This is optional and does not need to be implemented in PI3, but would be great for demo; if Team Buttons is looking for opportunities to showcase interesting GUIs, Zoom Windows are perfect opportunity (would require TMC and CSP to support these two parameters, corrBandwidth values > 0 and zoom window tuning.) | | |
| | type | integer | |
| | default | null | |
| | | | |
| <ul style="list-style-type: none">frequency_band_offset_stream2 | See frequencyBandOffsetStream1 | | |
| | type | integer | |
| | default | null | |
| | | | |
| <ul style="list-style-type: none">delay_model_subscription_point | FQDN of TMC.DelayModel TANGO attribute which exposes delay values for all the dishes assigned to a Subarray in JSON format. Delay values are updated every 10 seconds. | | |
| | type | string | |
| | default | null | |
| | | | |
| <ul style="list-style-type: none">doppler_phase_corr_subscription_point | The same model applies for all receptors that belong to the subarray. Defined by TMC using publish-subscribe mechanism (see ICD Section 3.8.8.5.3). The Doppler phase correction, by default, applies only to the CSP_Mid Processing Mode Correlation; optionally may apply to other Processing Modes as well. | | |
| | type | string | |
| | default | null | |
| | | | |
| <ul style="list-style-type: none">rfi_flagging_mask | Specified as needed in advance of the scan start and/or during the scan. Delivered using publish-subscribe mechanism (see ICD Section 3.8.8.5.7). | | |

VLBI config 2.0

Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| additionalProperties | False | |

Search window config 2.0

Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.

| | | | | |
|------------------------------------|--|----------------|------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • search_window_id | Identifier of the 300MHz Search Window. Unique within a sub-array. | | | |
| | type | <i>integer</i> | | |
| • search_window_tuning | The Search Window tuning is provided in absolute terms as RF center frequency. The Search Window must be placed within the observed band. If partially out of the observed Band a warning is generated. If completely outside of the observed Band an exception is generated. | | | |
| | type | <i>integer</i> | | |
| • tdc_enable | Enable / disable Transient Data Capture for the Search Window. | | | |
| | type | <i>boolean</i> | | |
| • tdc_num_bits | Number of bits per sample (for the Transient Data Capture). Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_before_epoch | Users can trade the period of time for which data are saved and transmitted for the sample bit-width and/or the number of Search Windows. The exact information regarding the memory capacity per receptor and supported range will be provided in construction. The epoch is specified in the command that triggers TDC off-loading (transmission of data). | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_after_epoch | see <i>tdcPeriodBeforeEpoch</i> | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_destination_addresses | Destination addresses (MAC, IP, port) for off-loading of the content of the Transient Data Capture Buffer, specified per receptor. The destination addresses for the content of the Transient Data Capture can be provided either as a part of the scan configuration or by the command that triggers transmission of the captured data. The latter, if provided, overrides previously set addresses. Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>array</i> | | |
| | default | null | | |

Common configuration schema 2.0

Common section, containing the parameters and the sections belonging to all CSP subsystems. This section is forwarded to all sub-elements.

| | | |
|----------------------|--|---|
| type | <i>object</i> | |
| properties | | |
| • config_id | type | <i>string</i> |
| | default | null |
| • subarray_id | Subarray number | |
| | type | <i>integer</i> |
| • eb_id | Execution block ID to associate scan configs to an observation. This ID is used for associating generated data, especially data products, for a given observation. Multiple scans can be linked to one observation and this ID is used as metadata to associate the data products from all scans of the same observation. This ID does not have to be unique for a scan configuration but should be unique for different observations. For example, all the data and weights files will have an EB_ID header value populated with the value supplied in this field. | |
| | type | <i>string</i> |
| | pattern | <code>^eb\[a-z0-9]+\-[0-9]{8}\-[a-z0-9]+\$</code> |
| | default | null |
| • band_5_tuning | Center frequency for the Band-of-Interest. Required if Band is 5a or 5b; not specified for other Bands (not configurable for Band 1, 2, 3 and 4). Input for Band 5a and 5b consists of two 2.5 GHz streams; the center frequency can be independently tuned for each stream. The following nomenclature is used to refer to Band 5a and 5b streams: 5a1, 5a2, 5b1, 5b2. | |
| | type | <i>array</i> |
| | default | null |
| | items | type <i>number</i> |
| • frequency_band | Frequency band applies for all the receptors (VCCs) that belong to the sub-array. | |
| | type | <i>string</i> |
| | pattern | <code>^(1 2 3 4 5(a b))\$</code> |
| additionalProperties | False | |

CBF config 2.0

Correlator and Beamformer specific parameters. This section contains the parameters relevant only for CBF sub-element. This section is forwarded only to CBF subelement. Most of it to be borrowed from IICD

| type | object | | |
|---|---|---|--------------------------|
| properties | | | |
| <ul style="list-style-type: none">frequency_band_offset_stream1 | Optionally, an offset can be specified so that the entire observed band is shifted (to accommodate a Zoom Window that crosses a ‘natural’ Frequency Slice boundary). If specified, applies for all the receptors in the sub-array. Bands 1, 2, 3 and 4: input from the receptor consists of a single data stream; the Frequency Band Offset (FBO) should be specified for Stream 1 only. Bands 5a and 5b: input from the receptor consists of two data streams; the FBO can be specified for each stream independently. Note: For Band 5a and 5b the frequency shift is performed by the receptor (DISH). Note: This is optional and does not need to be implemented in PI3, but would be great for demo; if Team Buttons is looking for opportunities to showcase interesting GUIs, Zoom Windows are perfect opportunity (would require TMC and CSP to support these two parameters, corrBandwidth values > 0 and zoom window tuning.) | | |
| | type | integer | |
| | default | null | |
| | | | |
| <ul style="list-style-type: none">frequency_band_offset_stream2 | See frequencyBandOffsetStream1 | | |
| | type | integer | |
| | default | null | |
| | | | |
| <ul style="list-style-type: none">delay_model_subscription_point | FQDN of TMC.DelayModel TANGO attribute which exposes delay values for all the dishes assigned to a Subarray in JSON format. Delay values are updated every 10 seconds. | | |
| | type | string | |
| | default | null | |
| | | | |
| <ul style="list-style-type: none">doppler_phase_corr_subscription_point | The same model applies for all receptors that belong to the subarray. Defined by TMC using publish-subscribe mechanism (see ICD Section 3.8.8.5.3). The Doppler phase correction, by default, applies only to the CSP_Mid Processing Mode Correlation; optionally may apply to other Processing Modes as well. | | |
| | type | string | |
| | default | null | |
| | | | |
| <ul style="list-style-type: none">rfi_flagging_mask | Specified as needed in advance of the scan start and/or during the scan. Delivered using publish-subscribe mechanism (see ICD Section 3.8.8.5.7). | | |
| | type | object | |
| | default | null | |
| | properties | | |
| | additionalProperties | | True |
| <ul style="list-style-type: none">fsp | type | array | |
| | items | FSP config 2.0 | |
| | | | |
| <ul style="list-style-type: none">vlbi | Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement. | | |
| | default | null | |
| | | | VLBI config 2.0 |
| | | | |
| <ul style="list-style-type: none">search_window | type | array | |
| | default | null | |
| | items | Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming. | |
| | | | Search window config 2.0 |
| | | | |
| additionalProperties | False | | |

FSP config 2.0

| | | | | |
|-------------------|--|--|--|--|
| type | object | | | |
| properties | | | | |
| • fsp_id | type | integer | | |
| • function_mode | allOf | type | string | |
| | | enum | CORR, PSS-BF, PST-BF, VLBI | |
| • receptors | Optionally a subset of receptors to be correlated can be specified. If not specified, all receptors that belong to the subarray are cross-correlated (i.e. visibilities for all the baselines in the subarray are generated and transmitted to SDP). Valid receptor IDs include: SKA dishes: “SKAnnn”, where nnn is a zero padded integer in the range of 001 to 133. MeerKAT dishes: “MKTnnn”, where nnn is a zero padded integer in the range of 000 to 063. | | | |
| | type | array | | |
| | default | null | | |
| | items | type | string | |
| | | pattern | ^(SKA(00[1-9][0[1-9][0-9]]1[0-2][0-9]13[0-3])) (MKT(0[0-5][0-9]06[0-3]))\$ | |
| • frequency_slice | Frequency Slice to be processed on this FSP (valid range depends on the Frequency Band). | | | |
| • zoom_factor | type | integer | | |
| | Bandwidth to be correlated calculated as FSBW/2n, where n is in range [0..6]. When n=0 the full Frequency Slice bandwidth is correlated. BW > 0 implies ‘Zoom Window’ configuration; the spectral Zoom Window tuning must be specified. | | | |
| | type | integer | | |
| • zoom_window | The Zoom Window tuning provided in absolute terms as RF center frequency. Based on that, CSB_Mid calculates tuning within the data stream received from the receptor. Must be selected so that the entire Zoom Window is within the Frequency Slice. If partially out of the FS a warning is generated. If completely outside of the FS an exception is generated. Step size <= 0.01MHz. The Frequency Band Offset can be used to shift the entire observed band in order to accommodate a Zoom Window that spans across a Frequency Slice boundary. | | | |
| | type | integer | | |
| | default | null | | |
| | • integration_factor | Integration time for the correlation products, defines multiple of 140 milliseconds. | | |
| type | | integer | | |

| | default | null | | | |
| | items | type | array | | |
| | | items | anyOf | type | integer |
| | | | | type | string |
| additionalProp- erties | False | | | | |

VLBI config 2.0

Very Long Baseline Interferometry specific parameters. To be borrowed from IICD This section contains the parameters relevant only for VLBI. This section is forwarded only to CSP subelement.

| | | |
|----------------------|---------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • dummy_param | type | <i>string</i> |
| additionalProperties | False | |

Search window config 2.0

Up to two 300 MHz Search Windows can be optionally configured and used as input for Transient Data Capture and/or Pulsar Search beam-forming.

| | | | | |
|------------------------------------|--|----------------|------|----------------|
| type | <i>object</i> | | | |
| properties | | | | |
| • search_window_id | Identifier of the 300MHz Search Window. Unique within a sub-array. | | | |
| | type | <i>integer</i> | | |
| • search_window_tuning | The Search Window tuning is provided in absolute terms as RF center frequency. The Search Window must be placed within the observed band. If partially out of the observed Band a warning is generated. If completely outside of the observed Band an exception is generated. | | | |
| | type | <i>integer</i> | | |
| • tdc_enable | Enable / disable Transient Data Capture for the Search Window. | | | |
| | type | <i>boolean</i> | | |
| • tdc_num_bits | Number of bits per sample (for the Transient Data Capture). Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_before_epoch | Users can trade the period of time for which data are saved and transmitted for the sample bit-width and/or the number of Search Windows. The exact information regarding the memory capacity per receptor and supported range will be provided in construction. The epoch is specified in the command that triggers TDC off-loading (transmission of data). | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_period_after_epoch | see <i>tdcPeriodBeforeEpoch</i> | | | |
| | type | <i>integer</i> | | |
| | default | null | | |
| • tdc_destination_addresses | Destination addresses (MAC, IP, port) for off-loading of the content of the Transient Data Capture Buffer, specified per receptor. The destination addresses for the content of the Transient Data Capture can be provided either as a part of the scan configuration or by the command that triggers transmission of the captured data. The latter, if provided, overrides previously set addresses. Required if TDC is enabled, otherwise not specified. | | | |
| | type | <i>array</i> | | |
| | default | null | | |
| | items | anyOf | type | <i>integer</i> |
| | | | type | <i>string</i> |

Contains information required to populate a delay model used determine the relative delay between stations. Includes information such as station location, and fixed delays such as cable lengths.

| | | |
|---|-------------------|--|
| https://schema.skao.int/ska-telmodel-layout/1.1 | | |
| type | object | |
| properties | | |
| • interface | Interface version | |
| | type | string |
| • telescope | SKA Telescope | |
| | type | string |
| • receptors | Receptors | |
| | type | array |
| | items | Identification, location and delay in- formation for a receptor |
| | | <i>Receptor 1.1</i> |
| additionalProperties | False | |

Receptor 1.1

Identification, location and delay information for a receptor

| | | |
|------------------------|---|---|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • station_label | Receptor or station label | |
| | type | <i>string</i> |
| • station_id | Receptor or station identifier | |
| | type | <i>integer</i> |
| • diameter | Receptor or station nominal diameter (m) | |
| | type | <i>number</i> |
| • location | Location of receptors coordinates | |
| | Coordinate Locations 1.1 | |
| • fixed_delays | Fixed delays | |
| | type | <i>array</i> |
| | items | A fixed delay representation, these are delays that are fixed to the station, such as cable lengths, electronic delays. This is configured to be per polarisation and the delay model can contain multiple delays and they can be stored in length or time. |
| | Fixed Delay 1.1 | |
| • niao | non-intersecting axis offset - between az and el axes | |
| | type | <i>number</i> |
| additionalProperties | False | |

Coordinate Locations 1.1

A representation of the receptor position. Multiple representations are supported.

| | | |
|----------------------|--|---------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • geocentric | Geocentric Location | |
| | ECEF - XYZ 1.1 | |
| • geodetic | Geodetic location | |
| | default | null |
| | Geodetic - lat,lon,h 1.1 | |
| • local | Local Geodetic location | |
| | default | null |
| | Local Geodetic - east, north, up 1.1 | |
| additionalProperties | False | |

ECEF - XYZ 1.1

Earth Centred Earth Fixed - Geocentric position (x,y,z) in meters. The centre of the Earth is defined by a given frame, usually a particular realisation of ITRF.

| | | |
|---------------------------|---------------------------------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • coordinate_frame | Coordinate frame for positions (ITRF) | |
| | type | <i>string</i> |
| • x | ECEF X coordinate (m) | |
| | type | <i>number</i> |
| • y | ECEF Y coordinate (m) | |
| | type | <i>number</i> |
| • z | ECEF Z coordinate (m) | |
| | type | <i>number</i> |
| additionalProperties | False | |

Geodetic - lat,lon,h 1.1

Global Geodetic position schema, Geodetic coordinate systems are based on a reference ellipsoid the coordinates are geodetic latitude (rad), longitude (rad) and height (m).

| | | |
|---------------------------|--|---------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • coordinate_frame | Coordinate frame or datum (e.g. ITRF or WGS84) | |
| | type | <i>string</i> |
| • lat | Geodetic latitude (rad) | |
| | type | <i>number</i> |
| • lon | Geodetic longitude (rad) | |
| | type | <i>number</i> |
| • h | height (m) | |
| | type | <i>number</i> |
| additionalProperties | False | |

Local Geodetic - east, north, up 1.1

Local Geodetic position schema. Local Geodetic coordinate systems are based on a reference ellipsoid and a geodetic reference position. They are generally specified in East (E), North (N), and Up (U) in meters

| | | |
|---------------------------|--|---------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • coordinate_frame | Coordinate frame or datum (e.g. ITRF or WGS84) | |
| | type | <i>string</i> |
| • east | Local Geodetic East (m) | |
| | type | <i>number</i> |
| • north | Local Geodetic North (m) | |
| | type | <i>number</i> |
| • up | Local Geodetic Height (m) | |
| | type | <i>number</i> |
| • reference | The geodetic reference position | |
| | <i>Geodetic - lat,lon,h 1.1</i> | |
| additionalProperties | False | |

Fixed Delay 1.1

A fixed delay representation, these are delays that are fixed to the station, such as cable lengths, electronic delays. This is configured to be per polarisation and the delay model can contain multiple delays and they can be stored in length or time.

| | | |
|-------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • fixed_delay_id | Identification for the delay | |
| | type | <i>string</i> |
| • polarisation | Which polarisation this delay is applied to | |
| | type | <i>integer</i> |
| • units | Units for the delay (seconds, metres) | |
| | type | <i>string</i> |
| • delay | The delay | |
| | type | <i>number</i> |
| additionalProperties | False | |

Receptor 1.0

Identification, location and delay information for a receptor

| | | |
|-----------------------|---|---|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • station_name | Receptor or station label | |
| | type | <i>string</i> |
| • diameter | Receptor or station nominal diameter (m) | |
| | type | <i>number</i> |
| • location | Location of receptors coordinates | |
| | | Coordinate Locations 1.0 |
| • fixed_delays | Fixed delays | |
| | type | <i>array</i> |
| | items | A fixed delay representation, these are delays that are fixed to the station, such as cable lengths, electronic delays. This is configured to be per polarisation and the delay model can contain multiple delays and they can be stored in length or time. |
| | | Fixed Delay 1.0 |
| • niao | non-intersecting axis offset - between az and el axes | |
| | type | <i>number</i> |
| additionalProperties | False | |

Coordinate Locations 1.0

A representation of the receptor position. Multiple representations are supported.

| | | |
|----------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • geocentric | Geocentric Location | |
| | <i>ECEF - XYZ 1.0</i> | |
| • geodetic | Geodetic location | |
| | default | null |
| | <i>Geodetic - lat,lon,h 1.0</i> | |
| • local | Local Geodetic location | |
| | default | null |
| | <i>Local Geodetic - east, north, up 1.0</i> | |
| additionalProperties | False | |

ECEF - XYZ 1.0

Earth Centred Earth Fixed - Geocentric position (x,y,z) in meters. The centre of the Earth is defined by a given frame, usually a particular realisation of ITRF.

| | | |
|---------------------------|---------------------------------------|---------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • coordinate_frame | Coordinate frame for positions (ITRF) | |
| | type | <i>string</i> |
| • x | ECEF X coordinate (m) | |
| | type | <i>number</i> |
| • y | ECEF Y coordinate (m) | |
| | type | <i>number</i> |
| • z | ECEF Z coordinate (m) | |
| | type | <i>number</i> |
| additionalProperties | False | |

Geodetic - lat,lon,h 1.0

Global Geodetic position schema, Geodetic coordinate systems are based on a reference ellipsoid the coordinates are geodetic latitude (rad), longitude (rad) and height (m).

| | | |
|---------------------------|--|---------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • coordinate_frame | Coordinate frame or datum (e.g. ITRF or WGS84) | |
| | type | <i>string</i> |
| • lat | Geodetic latitude (rad) | |
| | type | <i>number</i> |
| • lon | Geodetic longitude (rad) | |
| | type | <i>number</i> |
| • h | height (m) | |
| | type | <i>number</i> |
| additionalProperties | False | |

Local Geodetic - east, north, up 1.0

Local Geodetic position schema. Local Geodetic coordinate systems are based on a reference ellipsoid and a geodetic reference position. They are generally specified in East (E), North (N), and Up (U) in meters

| | | |
|---------------------------|---|---------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • coordinate_frame | Coordinate frame or datum (e.g. ITRF or WGS84) | |
| | type | <i>string</i> |
| • east | Local Geodetic East (m) | |
| | type | <i>number</i> |
| • north | Local Geodetic North (m) | |
| | type | <i>number</i> |
| • up | Local Geodetic Height (m) | |
| | type | <i>number</i> |
| • reference | The geodetic reference position | |
| | <i>Geodetic - lat,lon,h 1.0</i> | |
| additionalProperties | False | |

Fixed Delay 1.0

A fixed delay representation, these are delays that are fixed to the station, such as cable lengths, electronic delays. This is configured to be per polarisation and the delay model can contain multiple delays and they can be stored in length or time.

| | | |
|-------------------------|---|----------------|
| type | <i>object</i> | |
| properties | | |
| • interface | Interface version | |
| | type | <i>string</i> |
| • fixed_delay_id | Identification for the delay | |
| | type | <i>string</i> |
| • polarisation | Which polarisation this delay is applied to | |
| | type | <i>integer</i> |
| • units | Units for the delay (seconds, metres) | |
| | type | <i>string</i> |
| • delay | The delay | |
| | type | <i>number</i> |
| additionalProperties | False | |
